## Getting Started

Install Python 3.8 or higher.

Install `yamcs-client` from PyPI:

```
pip install --upgrade yamcs-client
```

## Usage

Get domain-specific clients:

```
from yamcs.client import YamcsClient
client = YamcsClient('localhost:8090')

mdb = client.get_mdb(instance='simulator')
# ...

archive = client.get_archive(instance='simulator')
# ...

processor = client.get_processor(instance='simulator', processor='realtime')
# ...
```

## Documentation

- [General Client](#)

## Examples

- [Examples](#)

# 1. General Client

## 1.1 Reference

### 1.1.1 YamcsClient

```
class yamcs.client.YamcsClient(address: str, * (Keyword-only parameters separator (PEP 3102)), tls: bool = False, tls_verify: bool | str = True, credentials: Credentials | None = None, user_agent: str | None = None, keep_alive: bool = True, on_token_update: Callable[[Credentials], None] | None = None)
```

Bases: [object](#)

Client for accessing core Yamcs resources.

#### Parameters

- **address** – The address of Yamcs in the format ‘hostname:port’
- **tls** – Whether TLS encryption is expected
- **tls\_verify** – Whether server certificate verification is enabled (only applicable if `tls=True`). As an alternative to a boolean value, this option may be set to a path containing the appropriate TLS CA certificate bundle.
- **credentials** – Credentials for when the server is secured
- **user\_agent** – Optionally override the default user agent
- **keep\_alive** – Automatically renew the client session. If disabled, the session will terminate after about 30 minutes of inactivity.

This property is only considered when accessing a server that requires authentication.

#### close()

Close this client session

```
compact_rdb_column_family(tablespace: str, cf: str, dbpath: str | None = None)
```

Compact a RocksDB column family.

#### Parameters

- **tablespace** – RocksDB tablespace name
- **cf** – Column family name
- **dbpath** – Optional path under the tablespace root.

```
create_event_subscription(instance: str, on_data: Callable[[Event], None], filter: str | None = None, timeout: float = 60) → WebSocketSubscriptionFuture
```

Create a new subscription for receiving events of an instance.

This method returns a future, then returns immediately. Stop the subscription by canceling the future.

### Parameters

- **instance** – A Yamcs instance name
- **on\_data** – Function that gets called on each [Event](#).
- **filter** – Filter query applied to returned events. Allows for both text and field search.

Added in version 1.10.1: Compatible with Yamcs v5.10.2 onwards

- **timeout** – The amount of seconds to wait for the request to complete.

### Returns

Future that can be used to manage the background websocket subscription.

**create\_instance**(*name*: *str*, *template*: *str*, *args*: *Mapping*[*str*, *Any*] | *None* = *None*, *labels*: *Mapping*[*str*, *str*] | *None* = *None*)

Create a new instance based on an existing template. This method blocks until the instance is fully started.

### Parameters

- **instance** – A Yamcs instance name.
- **template** – The name of an existing template.

**create\_link\_subscription**(*instance*: *str*, *on\_data*: *Callable*[[*List*[*Link*]], *None*] | *None* = *None*, *timeout*: *float* = 60) → *LinkSubscription*

Create a new subscription for receiving data link updates of an instance.

This method returns a future, then returns immediately. Stop the subscription by canceling the future.

### Parameters

- **instance** – A Yamcs instance name.
- **on\_data** – Function that gets called with [Link](#) updates. Each update contains state of all links.
- **timeout** – The amount of seconds to wait for the request to complete.

### Returns

Future that can be used to manage the background websocket subscription.

**create\_time\_subscription**(*instance*: *str*, *on\_data*: *Callable*[[*datetime*], *None*] | *None* = *None*, *timeout*: *float* = 60) → *TimeSubscription*

Create a new subscription for receiving time updates of an instance. Time updates are emitted at 1Hz.

This method returns a future, then returns immediately. Stop the subscription by canceling the future.

### Parameters

- **instance** – A Yamcs instance name
- **on\_data** – Function that gets called with [datetime](#) updates.
- **timeout** – The amount of seconds to wait for the request to complete.

### Returns

Future that can be used to manage the background websocket subscription.

**delete\_processor**(*instance*: *str*, *processor*: *str*)

Delete a processor.

### Parameters

- **instance** – A Yamcs instance name.
- **processor** – A processor name within that instance.

**static from\_environment()**

Create a *YamcsClient*, initialized from environment variables.

This recognizes the following environment variables:

**YAMCS\_URL**

Yamcs server URL

**YAMCS\_API\_KEY**

Yamcs API key (currently only assigned to script activities)

**get\_archive(instance: str) → ArchiveClient**

Return an object for working with the Archive of the specified instance.

**Parameters**

**instance** – A Yamcs instance name.

**get\_auth\_info() → AuthInfo**

Returns general authentication information. This operation does not require authenticating and is useful to test if a server requires authentication or not.

**get\_file\_transfer\_client(instance: str) → FileTransferClient**

Return an object for working with file transfers on a specified instance.

**Parameters**

**instance** – A Yamcs instance name.

**get\_link(instance: str, link: str) → LinkClient**

Return an object for working with a specific Yamcs link.

**Parameters**

- **instance** – A Yamcs instance name.
- **link** – A link name within that instance.

**get\_mdb(instance: str) → MDBClient**

Return an object for working with the MDB of the specified instance.

**Parameters**

**instance** – A Yamcs instance name.

**get\_processor(instance: str, processor: str) → ProcessorClient**

Return an object for working with a specific Yamcs processor.

**Parameters**

- **instance** – A Yamcs instance name.
- **processor** – A processor name within that instance.

**get\_server\_info() → ServerInfo**

Return general server info.

**get\_storage\_client() → StorageClient**

Return an object for working with object storage

**get\_tco\_client(instance: str, service: str) → TCOClient**

Return an object for Time Correlation API calls on a specified service.

**Parameters**

- **instance** – A Yamcs instance name.
- **service** – Target service name.

`get_time(instance)` → [datetime](#) | [None](#)

Return the current mission time for the specified instance.

`get_timeline_client(instance: str)` → [TimelineClient](#)

Return an object for working with Yamcs timeline items

**Parameters**

**instance** – A Yamcs instance name.

`get_user_info()` → [UserInfo](#)

Get information on the authenticated user.

`list_instance_templates()` → [Iterable\[InstanceTemplate\]](#)

List the available instance templates.

`list_instances()` → [Iterable\[Instance\]](#)

Lists the instances.

Instances are returned in lexicographical order.

`list_links(instance: str)` → [Iterable\[Link\]](#)

Lists the data links visible to this client.

Data links are returned in random order.

**Parameters**

**instance** – A Yamcs instance name.

`list_processors(instance: str | None = None)` → [Iterable\[Processor\]](#)

Lists the processors.

Processors are returned in lexicographical order.

**Parameters**

**instance** – A Yamcs instance name.

`list_rdb_tablespaces()` → [Iterable\[RdbTablespace\]](#)

Lists RocksDB tablespaces.

`list_services(instance: str)` → [Iterable\[Service\]](#)

List the services for an instance.

**Parameters**

**instance** – A Yamcs instance name.

`load_parameter_values(instance: str, data: Iterator[Mapping[str, 'ValueUpdate']], stream: str = 'pp_dump', chunk_size: int = 32768)` → [LoadParameterValuesResult](#)

Load an indefinite amount of parameter values into Yamcs.

Added in version 1.9.1: Compatible with Yamcs 5.8.8 onwards

**Parameters**

- **instance** – Yamcs instance name
- **data** – Generator that yields batches of parameter values, keyed by parameter name.
- **stream** – Stream where to send the parameters to.
- **chunk\_size** – HTTP chunk size. Multiple updates are grouped in chunks of about this size.

`restart_instance(instance: str)`

Restarts a single instance.

**Parameters**

**instance** – A Yamcs instance name.

`send_event`(*instance*: *str*, *message*: *str*, *event\_type*: *str* | *None* = *None*, *time*: *datetime* | *None* = *None*, *severity*: *str* | *None* = 'info', *source*: *str* | *None* = *None*, *sequence\_number*: *int* | *None* = *None*, *extra*: *Mapping*[*str*, *str*] | *None* = *None*)

Post a new event.

#### Parameters

- **instance** – A Yamcs instance name.
- **message** – Event message.
- **event\_type** – Type of event.
- **severity** – The severity level of the event. One of info, watch, warning, distress, critical or severe. Defaults to info.
- **time** – Time of the event. If unspecified, defaults to mission time.
- **source** – Source of the event. Useful for grouping events in the archive. When unset this defaults to User.
- **event\_type** – Event type.
- **sequence\_number** – Sequence number of this event. This is used to determine unicity of events at the same time and coming from the same source. If not set Yamcs will automatically assign a sequential number as if every submitted event is unique.
- **extra** – Extra event properties.

`start_instance`(*instance*: *str*)

Starts a single instance.

#### Parameters

- **instance** – A Yamcs instance name.

`start_service`(*instance*: *str*, *service*: *str*)

Starts a single service.

#### Parameters

- **instance** – A Yamcs instance name.
- **service** – The name of the service.

`stop_instance`(*instance*: *str*)

Stops a single instance.

#### Parameters

- **instance** – A Yamcs instance name.

`stop_service`(*instance*: *str*, *service*: *str*)

Stops a single service.

#### Parameters

- **instance** – A Yamcs instance name.
- **service** – The name of the service.

`class` `yamcs.client.TimeSubscription`(*manager*)

Bases: [WebSocketSubscriptionFuture](#)

Local object providing access to time updates.

A subscription object stores the last time info.

Initializes the future. Should not be called by clients.

**time:** `datetime` | `None`

The last time info.

**class** `yamcs.client.LinkSubscription`(*manager*)

Bases: `WebSocketSubscriptionFuture`

Local object providing access to data link updates.

A subscription object stores the last link info for each link.

Initializes the future. Should not be called by clients.

**get\_link**(*name: str*) → `Link` | `None`

Returns the latest link state.

#### Parameters

**name** – Identifying name of the data link

**list\_links**() → `List[Link]`

Returns a snapshot of all links.

## 1.1.2 Model

**class** `yamcs.client.AuthInfo`(*proto*)

Bases: `object`

Authentication information

**property** `require_authentication:` `bool`

**class** `yamcs.client.Event`(*proto*)

Bases: `object`

A timetagged free-text message. Events work a lot like log messages in logging frameworks, but then targeted at operators.

**property** `event_type:` `str` | `None`

The event type. This is mission-specific and can be any string.

**property** `extra:` `Dict[str, str]`

Dict with extra event properties.

**property** `generation_time:` `datetime`

The time when the event was generated.

**property** `message:` `str` | `None`

Event message.

**property** `reception_time:` `datetime`

The time when the event was received by Yamcs.

**property** `sequence_number:` `int`

Sequence number. Usually this is assigned by the source of the event.

**property** `severity:` `str` | `None`

Severity level of the event. One of INFO, WATCH, WARNING, DISTRESS, CRITICAL or SEVERE.

**property** `source:` `str` | `None`

The event source. Can be any string.

**class** `yamcs.client.Instance`(*proto*)

Bases: `object`

**property failure\_cause:** `str` | `None`

Failure message when state == 'FAILED'

**property mission\_time:** `datetime` | `None`

Mission time of this instance's time service.

**property name:** `str`

Name of this instance.

**property state:** `str`

State of this instance. One of OFFLINE, INITIALIZING, INITIALIZED, STARTING, RUNNING, STOPPING or FAILED.

**class** `yamcs.client.InstanceTemplate(proto)`

Bases: `object`

A template for creating an instance.

**property name:** `str`

Name of this template.

**class** `yamcs.client.Link(proto)`

Bases: `object`

Represents a link with an external system. Depending on the semantics of the link, this may imply inbound data, outbound data or a combination of both.

**property actions:** `List[LinkAction]`

Custom actions.

**property class\_name:** `str`

Name of this link's class.

**property enabled:** `bool`

If True, this link accepts or outputs data.

**property extra:** `Dict[str, Any]`

Custom info fields.

**property in\_count:** `int`

packet count).

**Type**

The number of inbound data events (example

**property instance:** `str`

Name of the instance where this link is defined.

**property name:** `str`

Name of this link (unique per instance).

**property out\_count:** `int`

command count).

**Type**

The number of outbound data events (example

**property status:** `str`

Short status.

**class** `yamcs.client.LinkAction(proto)`

Bases: `object`

**property checked:** `bool`

Whether the action is currently checked

**property enabled:** `bool`

Whether the action is currently enabled

**property id:** `str`

Action ID

**property label:** `str`

Label for the action

**property style:** `str`

Action style

**class** `yamcs.client.LoadParameterValuesResult(proto)`

Bases: `object`

Statistics returned when loading a stream of parameter values.

**property max\_generation\_time:** `datetime | None`

Maximum generation time of all loaded parameter values

**property min\_generation\_time:** `datetime | None`

Minimum generation time of all loaded parameter values

**property value\_count:** `str`

Number of loaded parameter values.

**class** `yamcs.client.ObjectPrivilege(proto)`

Bases: `object`

**property name:** `str`

**property objects:** `List[str]`

**class** `yamcs.client.Processor(proto)`

Bases: `object`

**property instance:** `str`

Name of the instance where this processor is defined.

**property mission\_time:** `datetime | None`

Mission time of this processor.

**property name:** `str`

Name of this processor.

**property owner:** `str`

User that owns this processor.

**property persistent:** `bool`

If True, this processor does not close if no clients are connected.

**property protected:** `bool`

If True, this processor can not be deleted.

**property state:** `str`

State of this processor.

**property type:** `str`

Type of this processor.

```

class yamcs.client.RdbTablespace(proto)
    Bases: object
    property data_dir: str
        Data directory
    property name: str
        Tablespace name
class yamcs.client.ServerInfo(proto)
    Bases: object
    General server properties.
    property default_yamcs_instance: str | None
        Returns the default Yamcs instance.
    property id: str
        The Server ID.
    property version: str
        The version of Yamcs Server.
class yamcs.client.Service(proto)
    Bases: object
    A Yamcs service.
    property class_name: str
        Name of this service's class.
    failure_cause() → str | None
        Java stacktrace when state is FAILED
        Added in version 1.9.0: Compatible with Yamcs 5.8.0 onwards
    failure_message() → str | None
        Short failure message when state is FAILED
        Added in version 1.9.0: Compatible with Yamcs 5.8.0 onwards
    property instance: str | None
        Name of the instance where this service is defined.
    property name: str
        Name of this service.
    property processor: str | None
        Name of the processor where this service is defined.
    property state: str
        State of this service.
class yamcs.client.UserInfo(proto)
    Bases: object
    Info on a Yamcs User.
    property object_privileges: List[ObjectPrivilege]
    property superuser: bool
    property system_privileges: List[str]
    property username: str

```

## 1.1.3 Authentication

### 1.1.3.1 User Accounts

Yamcs Server can be configured for different authentication setups.

The common use case is to entrust Yamcs with validating user credentials (either by locally verifying passwords, or by delegating to an upstream server such as an LDAP tree).

To authenticate in such a scenario, do:

```
credentials = Credentials(username="admin", password="password")
client = YamcsClient("localhost:8090", credentials=credentials)
```

In the background this will convert your username/password credentials to an access token with limited lifetime, and a long-lived refresh token for automatically generating new access tokens.

Further HTTP requests do not use your username/password but instead use these tokens.

### 1.1.3.2 Service Accounts

Service accounts are useful in server-to-server scenarios. Support for service accounts will be available in future releases.

### 1.1.3.3 Types

```
class yamcs.client.APIKeyCredentials(key: str)
```

Bases: [Credentials](#)

`before_request(session: Session, auth_url: str)`

`is_expired() → bool`

`login(*args, **kwargs)`

`refresh()`

```
class yamcs.client.BasicAuthCredentials(username: str, password: str)
```

Bases: [Credentials](#)

Data holder for Basic Auth credentials. This includes a username and a password which are passed in the HTTP Authorization header on each request.

`before_request(session: Session, auth_url: str)`

`is_expired() → bool`

`login(*args, **kwargs)`

`refresh()`

```
class yamcs.client.Credentials(username: str | None = None, password: str | None = None,
                                access_token: str | None = None, refresh_token: str | None = None,
                                expiry: datetime | None = None, client_id: str | None = None,
                                client_secret: str | None = None, become: str | None = None)
```

Bases: [object](#)

Data holder for different types of credentials. Currently this includes:

- Username/password credentials (fields `username` and `password`)
- Bearer tokens (fields `access_token` and optionally `refresh_token`)

**access\_token**

Short-lived bearer token.

**become**

Name of the user to impersonate. Only service accounts with impersonation authority can use this feature.

**before\_request**(*session*: [Session](#), *auth\_url*: *str*)

**client\_id**

The client ID. Currently used only by service accounts.

**client\_secret**

The client secret. Currently used only by service accounts.

**expiry**

When this token expires.

**is\_expired**() → *bool*

**login**(*session*: [Session](#), *auth\_url*: *str*, *on\_token\_update*: [Callable](#)[[[Credentials](#)], *None*] | *None*) → [Credentials](#)

**password**

Clear-text password (consider TLS!).

**refresh**(*session*: [Session](#), *auth\_url*: *str*)

**refresh\_token**

Refresh token used to request a new access token.

**username**

Username (only needed when using username/password credentials).

## 1.1.4 Exceptions

**class** `yamcs.client.ConnectionFailure`

Bases: [YamcsError](#)

Yamcs is not or no longer available.

**class** `yamcs.client.NotFound`

Bases: [YamcsError](#)

The resource was not found.

**class** `yamcs.client.TimeoutError`

Bases: [YamcsError](#)

The operation exceeded the given deadline.

**class** `yamcs.client.Unauthorized`

Bases: [YamcsError](#)

Unable to get access the resource.

**class** `yamcs.client.YamcsError`

Bases: [Exception](#)

Base class for raised exceptions.

## 1.1.5 Futures

`class yamcs.client.WebSocketSubscriptionFuture(manager: WebSocketSubscriptionManager)`

Bases: Future

Future for capturing the asynchronous execution of a WebSocket subscription.

Initializes the future. Should not be called by clients.

`add_done_callback(fn)`

Attaches a callable that will be called when the future finishes.

**Parameters**

**fn** – A callable that will be called with this future as its only argument when the future completes or is cancelled. The callable will always be called by a thread in the same process in which it was added. If the future has already completed or been cancelled then the callable will be called immediately. These callables are called in the order that they were added.

`cancel()`

Closes the websocket and shutdowns the background thread consuming messages.

`cancelled()`

Return True if the future was cancelled.

`done()`

Return True if the future was cancelled or finished executing.

`exception(timeout=None)`

Return the exception raised by the call that the future represents.

**Parameters**

**timeout** – The number of seconds to wait for the exception if the future isn't done. If None, then there is no limit on the wait time.

**Returns**

The exception raised by the call that the future represents or None if the call completed without raising.

**Raises**

- **CancelledError** – If the future was cancelled.
- **TimeoutError** – If the future didn't finish executing before the given timeout.

`reply(timeout=None)`

Returns the initial reply. This is emitted before any subscription data is emitted. This function raises an exception if the subscription attempt failed.

`result(timeout=None)`

Return the result of the call that the future represents.

**Parameters**

**timeout** – The number of seconds to wait for the result if the future isn't done. If None, then there is no limit on the wait time.

**Returns**

The result of the call that the future represents.

**Raises**

- **CancelledError** – If the future was cancelled.
- **TimeoutError** – If the future didn't finish executing before the given timeout.
- **Exception** – If the call raised then that exception will be raised.

`running()`

Return True if the future is currently executing.

`set_exception(exception)`

Sets the result of the future as being the given exception.

Should only be used by Executor implementations and unit tests.

`set_result(result)`

Sets the return value of work associated with the future.

Should only be used by Executor implementations and unit tests.

## 1.2 Snippets

Create a `YamcsClient`:

```
from yamcs.client import YamcsClient
client = YamcsClient('localhost:8090')
```

Provide credentials if Yamcs is secured:

```
from yamcs.client import Credentials, YamcsClient
credentials = Credentials(username='admin', password='password')
client = YamcsClient('localhost:8090', credentials=credentials)
```

### 1.2.1 Events

Receive `Event` callbacks:

```
def callback(event):
    print("Event:", event)

client.create_event_subscription(instance="simulator", on_data=callback)

sleep(5) # Subscription is non-blocking
```

Send an event:

```
client.send_event(instance="simulator", message="hello world")
```

## 2. Mission Database

The Mission Database API provides methods for reading the entries in a Yamcs Mission Database (MDB). An MDB groups telemetry and command definitions for one or more *space systems*. The MDB is used to:

- Instruct Yamcs how to process incoming packets
- Describe items in Yamcs Archive
- Instruct Yamcs how to compose telecommands

Space systems form a hierarchical multi-rooted tree. Each level of the tree may contain any number of definitions. These break down in:

- parameters
- containers
- commands
- algorithms

Entries in the Space system are addressable via a qualified name that looks like a Unix file path. Each segment of the path contains the name of the space system node, the final path segment is the name of the entry itself.

For example, in an MDB that contains these parameter entries:

we find two space systems `/YSS` and `/YSS/SIMULATOR` and two parameter entries `/YSS/SIMULATOR/BatteryVoltage1` and `/YSS/SIMULATOR/BatteryVoltage2`.

Some MDB entries may also define an alias. An alias is a unique name to address the entry under a custom namespace (unrelated to XTCE space systems).

When it comes to addressing entries via this client, it is possible to provide either the fully-qualified XTCE name in the format `/YSS/SIMULATOR/BatteryVoltage1` or an alias in the format `NAMESPACE/NAME`.

### 2.1 Reference

#### 2.1.1 Client

##### **Note**

MDBClient instances are usually created via `YamcsClient.get_mdb()`:

```
from yamcs.client import YamcsClient

client = YamcsClient('localhost:8090')
mdb = client.get_mdb(instance='simulator')
# ...
```

```
class yamcs.client.MDBClient(ctx: Context, instance: str)
```

```
create_parameter(name: str, data_source: str, short_description: str | None = None,  
long_description: str | None = None, aliases: Mapping[str, str] | None = None,  
parameter_type: str | None = None) → Parameter
```

Create a parameter.

Added in version 1.9.1: Compatible with Yamcs 5.8.8 onwards

#### Parameters

- **name** – Fully qualified name of the parameter.  
Space systems that do not yet exist, will be added automatically.
- **data\_source** – Where this parameter originated. One of TELEMETERED, GROUND, DERIVED, CONSTANT, LOCAL, SYSTEM, COMMAND, COMMAND\_HISTORY.
- **short\_description** – Short description (one line)
- **long\_description** – Long description (Markdown)
- **aliases** – Aliases, keyed by namespace.
- **parameter\_type** – Qualified name of a parameter type. This is optional, but recommended. It allows specifying units, alarms and so on.

```
create_parameter_type(name: str, eng_type: str, short_description: str | None = None,  
long_description: str | None = None, aliases: Mapping[str, str] | None =  
None, unit: str | None = None, signed: bool | None = None, enum_values:  
Mapping[int, str] | None = None, one_string_value: str | None = None,  
zero_string_value: str | None = None, default_alarm: RangeSet | None =  
None, context_alarms: Mapping[str, RangeSet] | None = None) →  
ParameterType
```

Create a parameter type.

Added in version 1.9.1: Compatible with Yamcs 5.8.8 onwards

#### Parameters

- **name** – Fully qualified name of the parameter type.  
Space systems that do not yet exist, will be added automatically.
- **eng\_type** – Engineering type. One of float, integer, boolean, binary, string or enumeration.
- **short\_description** – Short description (one line)
- **long\_description** – Long description (Markdown)
- **aliases** – Aliases, keyed by namespace.
- **unit** – Engineering unit
- **signed** – Whether the engineering type supports signed representation. (only used with integer parameter types)
- **enum\_values** – Enumeration labels, keyed by integer value (only used with enumeration parameter types)
- **one\_string\_value** – String representation of a boolean one. (only used with boolean parameter types)
- **zero\_string\_value** – String representation of a boolean zero. (only used with boolean parameter types)

- **default\_alarm** – Default alarm, effective when no contextual alarm takes precedence.
- **context\_alarms** – Contextual alarms, keyed by condition.

**export\_space\_system**(*name: str*, \*, *version: str = '1.2'*) → *str*

Exports an XTCE description of a space system (XML format).

Added in version 1.9.0: Compatible with Yamcs 5.8.0 onwards

**Parameters**

- **name** – A fully-qualified XTCE name. Use / for root.
- **version** – XTCE version. One of 1.2 or 1.3.

Added in version 1.13.0: Compatible with Yamcs 5.12.6 onwards

**get\_algorithm**(*name: str*) → *Algorithm*

Gets a single algorithm by its unique name.

**Parameters**

**name** – Either a fully-qualified XTCE name or an alias in the format NAMESPACE/NAME.

**get\_command**(*name: str*) → *Command*

Gets a single command by its unique name.

**Parameters**

**name** – Either a fully-qualified XTCE name or an alias in the format NAMESPACE/NAME.

**get\_container**(*name: str*) → *Container*

Gets a single container by its unique name.

**Parameters**

**name** – Either a fully-qualified XTCE name or an alias in the format NAMESPACE/NAME.

**get\_parameter**(*name: str*) → *Parameter*

Gets a single parameter by its name.

**Parameters**

**name** – Either a fully-qualified XTCE name or an alias in the format NAMESPACE/NAME.

**get\_parameter\_type**(*name: str*) → *ParameterType*

Gets a single parameter type by its name.

Added in version 1.9.1: Compatible with Yamcs 5.8.8 onwards

**Parameters**

**name** – Either a fully-qualified XTCE name or an alias in the format NAMESPACE/NAME.

**get\_space\_system**(*name: str*) → *SpaceSystem*

Gets a single space system by its unique name.

**Parameters**

**name** – A fully-qualified XTCE name. Use / for root.

**list\_algorithms**(*page\_size: int | None = None*) → *Iterable[Algorithm]*

Lists the algorithms visible to this client.

Algorithms are returned in lexicographical order.

**list\_commands**(*page\_size: int | None = None*) → *Iterable[Command]*

Lists the commands visible to this client.

Commands are returned in lexicographical order.

**list\_containers**(*page\_size*: *int* | *None* = *None*) → *Iterable*[*Container*]

Lists the containers visible to this client.

Containers are returned in lexicographical order.

**list\_parameter\_types**(*page\_size*: *int* | *None* = *None*) → *Iterable*[*ParameterType*]

Lists the parameter types visible to this client.

Parameter types are returned in lexicographical order.

Added in version 1.9.1: Compatible with Yamcs 5.8.8 onwards

**list\_parameters**(*parameter\_type*: *str* | *None* = *None*, *page\_size*: *int* | *None* = *None*) → *Iterable*[*Parameter*]

Lists the parameters visible to this client.

Parameters are returned in lexicographical order.

#### Parameters

**parameter\_type** – The type of parameter

**list\_space\_systems**(*page\_size*: *int* | *None* = *None*) → *Iterable*[*SpaceSystem*]

Lists the space systems visible to this client.

Space systems are returned in lexicographical order.

## 2.1.2 Model

**class** `yamcs.client.Algorithm(proto)`

Bases: `MissionDatabaseItem`

**class** `yamcs.client.Argument(proto)`

Bases: `object`

**property** `description`: `str` | `None`

Short description

**property** `initial_value`: `str` | `None`

Initial value

**property** `name`: `str`

Argument name

**property** `type`: `ArgumentType`

Argument type information

**class** `yamcs.client.ArgumentType(proto)`

Bases: `object`

**property** `eng_type`: `str`

Engineering type

**property** `name`: `str`

Type name

**class** `yamcs.client.ArrayType(proto)`

Bases: `object`

**property** `array_type`: `ArrayType` | `None`

In case the elements of an array of this type are also of type `array`, this returns type info of the elements' array type.

**Note**

This is an uncommon use case. Multi-dimensional arrays are more prevalent.

**property dimensions:** `int | None`

The number of dimensions in case of a multi-dimensional array.

**property members:** `List[Member]`

In case the elements of this array are of type *aggregate*, this returns an ordered list of its direct sub-members.

**property name:** `str`

Short name of this type.

**class** `yamcs.client.Command(proto)`

Bases: `MissionDatabaseItem`

**property abstract:** `bool`

Whether this is an abstract command. Abstract commands are intended for inheritance and cannot be issued directly.

**property arguments:** `List[Argument]`

**property base\_command:** `Command | None`

**property significance:** `Significance | None`

**class** `yamcs.client.Container(proto)`

Bases: `MissionDatabaseItem`

**class** `yamcs.client.DataEncoding(proto)`

Bases: `object`

**property bitlength:** `int | None`

The size in bits

**property encoding:** `str | None`

Encoding detail

**property little\_endian:** `bool`

True if little-endian

**property type:** `str`

Raw type

**class** `yamcs.client.EnumValue(proto)`

Bases: `object`

**property description:** `str | None`

State description

**property label:** `str`

String value

**property value:** `int`

Numeric value

**class** `yamcs.client.Member(proto)`

Bases: `object`

A member is a data structure for a specific field of a parent data type (either another member, or a parameter of type *aggregate*).

This is similar to C structs. The top-level of a member hierarchy is a parameter of type *aggregate*.

**property array\_type:** [ArrayType](#) | **None**

In case this member is of type *array*, this returns array-specific type info.

**property members:** [List\[Member\]](#)

In case this member is of type *aggregate*, this returns an ordered list of its direct sub-members.

**property name:** **str**

Short name

**property type:** **str**

Engineering type.

**class** `yamcs.client.MissionDatabaseItem(proto)`

Bases: [ABC](#)

Superclass for MDB items. Implementations:

- [Algorithm](#)
- [Command](#)
- [Container](#)
- [Parameter](#)
- [ParameterType](#)
- [SpaceSystem](#)

**property aliases:** [Dict\[str, str\]](#)

Aliases, keyed by namespace

**property aliases\_dict:** [Dict\[str, str\]](#)

Aliases, keyed by namespace

This method shall be deprecated in a future release. Use [aliases](#) instead.

**property description:** **str** | **None**

Short description.

**property long\_description:** **str** | **None**

Long description.

**property name:** **str**

Short name

**property qualified\_name:** **str**

Full name (incl. space system)

**class** `yamcs.client.Parameter(proto)`

Bases: [MissionDatabaseItem](#)

A Parameter is a description of something that can have a value. It is not the value itself.

**property array\_type:** [ArrayType](#) | **None**

In case this parameter is of type *array*, this returns array-specific type info.

**property data\_encoding:** [DataEncoding](#) | **None**

Information on the raw encoding of this parameter, if applicable.

**property data\_source:** **str** | **None**

TELEMETERED)

**Type**

Specifies the source of this parameter (example

**property enum\_values:** `List[EnumValue]`

In case this parameter is of type *enumeration*, this returns an ordered list of possible values.

**property members:** `List[Member]`

In case this parameter is of type *aggregate*, this returns an ordered list of its direct members.

**property type:** `str | None`

Engineering type.

**property units:** `List[str]`

Engineering unit(s)

**class** `yamcs.client.ParameterType(proto)`

Bases: `MissionDatabaseItem`

**property array\_type:** `ArrayType | None`

In case this parameter type is of type *array*, this returns array-specific type info.

**property data\_encoding:** `DataEncoding | None`

Information on the raw encoding of this parameter type, if applicable.

**property enum\_values:** `List[EnumValue]`

In case this parameter type is of type *enumeration*, this returns an ordered list of possible values.

**property members:** `List[Member]`

In case this parameter type is of type *aggregate*, this returns an ordered list of its direct members.

**property type:** `str`

Engineering type.

**property units:** `List[str]`

Engineering unit(s)

**class** `yamcs.client.RangeSet(watch: Tuple[float | None, float | None] | None = None, warning: Tuple[float | None, float | None] | None = None, distress: Tuple[float | None, float | None] | None = None, critical: Tuple[float | None, float | None] | None = None, severe: Tuple[float | None, float | None] | None = None, min_violations: int = 1)`

Bases: `object`

A set of alarm ranges that apply in a specific context.

#### Parameters

- **watch** – Range expressed as a tuple (lo, hi) where lo and hi are assumed exclusive.
- **warning** – Range expressed as a tuple (lo, hi) where lo and hi are assumed exclusive.
- **distress** – Range expressed as a tuple (lo, hi) where lo and hi are assumed exclusive.
- **critical** – Range expressed as a tuple (lo, hi) where lo and hi are assumed exclusive.
- **severe** – Range expressed as a tuple (lo, hi) where lo and hi are assumed exclusive.
- **min\_violations** – Minimum violations before an alarm is generated.

**class** `yamcs.client.Significance(proto)`

Bases: `object`

**property consequence\_level:** `str`

One of NONE, WATCH, WARNING, DISTRESS, CRITICAL or SEVERE.

**property reason:** `str` | `None`

Message attached to this significance.

**class** `yamcs.client.SpaceSystem(proto)`

Bases: [MissionDatabaseItem](#)

From XTCE:

A SpaceSystem is a collection of SpaceSystem(s) including space assets, ground assets, multi-satellite systems and sub-systems. A SpaceSystem is the root element for the set of data necessary to monitor and command an arbitrary space device - this includes the binary decomposition of the data streams going into and out of a device.

## 2.2 Snippets

Create an [MDBClient](#) for a specific instance:

```
from yamcs.client import YamcsClient

client = YamcsClient('localhost:8090')
mdb = client.get_mdb(instance='simulator')
```

Print all space systems:

```
for space_system in mdb.list_space_systems():
    print(space_system)
```

Print all parameters of type float:

```
for parameter in mdb.list_parameters(parameter_type="float"):
    print(parameter)
```

Print all commands:

```
for command in mdb.list_commands():
    print(command)
```

Find a parameter by qualified name or alias:

```
p1 = mdb.get_parameter("/YSS/SIMULATOR/BatteryVoltage2")
print("Via qualified name:", p1)

p2 = mdb.get_parameter("MDB:OPS Name/SIMULATOR_BatteryVoltage2")
print("Via domain-specific alias:", p2)
```

## 3. TM/TC Processing

The TM/TC API provides methods that you can use to programmatically interact with a TM/TC processor.

### 3.1 Reference

#### 3.1.1 Client

##### Note

ProcessorClient instances are usually created via `YamcsClient.get_processor()`:

```
from yamcs.client import YamcsClient

client = YamcsClient('localhost:8090')
processor = client.get_processor(instance='simulator',
                                processor='realtime')

# ...
```

`class yamcs.client.ProcessorClient`(*ctx: Context, instance: str, processor: str*)

Client object that groups operations linked to a specific processor.

`acknowledge_alarm`(*alarm: str, sequence\_number: int, comment: str | None = None*)

Acknowledges a specific alarm.

##### Parameters

- **alarm** – Alarm name
- **sequence\_number** – Sequence number
- **comment** – Optional comment to associate with the state change.

`clear_alarm`(*alarm: str, sequence\_number: int, comment: str | None = None*)

Clear an alarm.

##### Note

If the reason that caused the alarm is still present, a new alarm instance will be generated.

##### Parameters

- **alarm** – Alarm name
- **sequence\_number** – Sequence number
- **comment** – Optional comment to associate with the state change.

`clear_alarm_ranges`(parameter: *str*)

Removes all alarm limits for the specified parameter.

`clear_calibrators`(parameter: *str*)

Removes all calibrators for the specified parameter.

`create_alarm_subscription`(on\_data: *Callable*[[*AlarmUpdate*], *None*] | *None* = *None*,  
include\_pending: *bool* = *False*, timeout: *float* = 60) →  
*AlarmSubscription*

Create a new alarm subscription.

#### Parameters

- **on\_data** – Function that gets called with *AlarmUpdate* updates.
- **timeout** – The amount of seconds to wait for the request to complete.
- **include\_pending** – Whether to include alarms that are currently pending, because they have not reached the minimum violation count.

Added in version 1.11.2: Compatible with Yamcs 5.11.0 onwards

#### Returns

A Future that can be used to manage the background websocket subscription.

`create_command_connection`(on\_data: *Callable*[[*CommandHistory*], *None*] | *None* = *None*, timeout:  
*float* = 60) → *CommandConnection*

Creates a connection for issuing multiple commands and following up on their acknowledgment progress.

#### Note

This is a convenience method that merges the functionalities of *create\_command\_history\_subscription()* with those of *issue\_command()*.

#### Parameters

- **on\_data** – Function that gets called with *CommandHistory* updates. Only commands issued from this connection are reported.
- **timeout** – The amount of seconds to wait for the request to complete.

#### Returns

Future that can be used to manage the background websocket subscription

`create_command_history_subscription`(on\_data: *Callable*[[*CommandHistory*], *None*] | *None* =  
*None*, timeout: *float* = 60) →  
*CommandHistorySubscription*

Create a new command history subscription.

#### Parameters

- **on\_data** – Function that gets called with *CommandHistory* updates.
- **timeout** – The amount of seconds to wait for the request to complete.

#### Returns

Future that can be used to manage the background websocket subscription.

`create_container_subscription`(containers: *str* | *List*[*str*], on\_data: *Callable*[[*ContainerData*],  
*None*] | *None* = *None*, timeout: *float* = 60) →  
*ContainerSubscription*

Create a new container subscription.

### Parameters

- **containers** – Container names.
- **on\_data** – Function that gets called with [ContainerData](#) updates.
- **timeout** – The amount of seconds to wait for the request to complete.

### Returns

A Future that can be used to manage the background websocket subscription.

`create_packet_subscription(on_data: Callable[[Packet], None], stream: str | None = None, timeout: float = 60) → WebSocketSubscriptionFuture`

Create a new packet subscription.

### Parameters

- **on\_data** – Function that gets called with [Packet](#) updates.
- **stream** – Stream to subscribe to.
- **timeout** – The amount of seconds to wait for the request to complete.

### Returns

A Future that can be used to manage the background websocket subscription.

`create_parameter_subscription(parameters: str | List[str], on_data: Callable[[ParameterData], None] | None = None, abort_on_invalid: bool = True, update_on_expiration: bool = False, send_from_cache: bool = True, timeout: float = 60) → ParameterSubscription`

Create a new parameter subscription.

### Parameters

- **parameters** – Parameter names (or aliases).
- **on\_data** – Function that gets called with [ParameterData](#) updates.
- **abort\_on\_invalid** – If True an error is generated when invalid parameters are specified.
- **update\_on\_expiration** – If True an update is received when a parameter value has become expired. This update holds the same value as the last known valid value, but with status set to EXPIRED.
- **send\_from\_cache** – If True the last processed parameter value is sent from parameter cache. When False only newly processed parameters are received.
- **timeout** – The amount of seconds to wait for the request to complete.

### Returns

A Future that can be used to manage the background websocket subscription.

`get_parameter_value(parameter: str, from_cache: bool = True, timeout: float = 10) → ParameterValue | None`

Retrieve the current value of the specified parameter.

### Parameters

- **parameter** – Either a fully-qualified XTCE name or an alias in the format NAMESPACE/NAME.
- **from\_cache** – If False this call will block until a fresh value is received on the processor. If True the server returns the latest value instead (which may be None).
- **timeout** – The amount of seconds to wait for a fresh value. (ignored if from\_cache=True).

`get_parameter_values(parameters: List[str], from_cache: bool = True, timeout: float = 10) → List[ParameterValue | None]`

Retrieve the current value of the specified parameter.

#### Parameters

- **parameters** – List of parameter names. These may be fully-qualified XTCE name or an alias in the format `NAMESPACE/NAME`.
- **from\_cache** – If `False` this call will block until fresh values are received on the processor. If `True` the server returns the latest value instead (which may be `None`).
- **timeout** – The amount of seconds to wait for a fresh values (ignored if `from_cache=True`).

#### Returns

A list that matches the length and order of the requested list of parameters. Each entry contains either the returned parameter value, or `None`.

`issue_command(command: str, args: Mapping[str, Any] | None = None, *, dry_run: bool = False, comment: str | None = None, verification: VerificationConfig | None = None, stream: str | None = None, extra: Mapping[str, Any] | None = None, sequence_number: int | None = None) → IssuedCommand`

Issue the given command

#### Parameters

- **command** – Either a fully-qualified XTCE name or an alias in the format `NAMESPACE/NAME`.
- **args** – Named arguments (if the command requires any).
- **dry\_run** – If `True` the command is not actually issued. This can be used to test if the server would generate errors when preparing the command (for example because an argument is missing).
- **comment** – Comment attached to the command.
- **verification** – Overrides to the default verification handling of this command.
- **stream** – Override the stream on which the command should be sent out.

Added in version 1.9.6.

- **extra** – Extra command options for interpretation by non-core extensions (custom preprocessor, datalinks, command listeners). Note that Yamcs will refuse command options that it does not know about. Extensions should therefore register available options.
- **sequence\_number** – Sequence number of this command. This is used to determine unicity of commands at the same time and coming from the same origin. If not set Yamcs will automatically assign a sequential number as if every submitted command is unique.

Added in version 1.9.0.

#### Returns

An object providing access to properties of the newly issued command.

`list_alarms(start: datetime | None = None, stop: datetime | None = None, include_pending=False) → Iterable[Alarm]`

Lists the active alarms.

Remark that this does not query the archive. Only active alarms on the current processor are returned.

#### Parameters

- **start** – Minimum trigger time of the returned alarms (inclusive)
- **stop** – Maximum trigger time of the returned alarms (exclusive)
- **include\_pending** – Whether to include alarms that are currently pending, because they have not reached the minimum violation count.

Added in version 1.11.2: Compatible with Yamcs 5.11.0 onwards

**reset\_alarm\_ranges**(parameter: *str*)

Reset all alarm limits for the specified parameter to their original MDB value.

**reset\_algorithm**(parameter: *str*)

Reset the algorithm text to its original definition from MDB

#### Parameters

**parameter** – Either a fully-qualified XTCE name or an alias in the format NAMESPACE/NAME.

**reset\_calibrators**(parameter: *str*)

Reset all calibrators for the specified parameter to their original MDB value.

**run\_script**(script: *str*, args: *str* | *List*[*str*] | *None* = *None*)

Run a script.

The script has access to the environment variables YAMCS\_URL, YAMCS\_API\_KEY, YAMCS\_INSTANCE and YAMCS\_PROCESSOR.

#### Parameters

- **script** – This should be the relative path to an executable file in one of the search locations. When unconfigured, the default search location is etc/scripts/ relative to the Yamcs working directory.
- **args** – Optional script arguments, passed verbatim in the command line.

**set\_alarm\_range\_sets**(parameter: *str*, sets: *List*[*AlarmRangeSet*])

Apply an ordered list of alarm range sets for the specified parameter. This replaces existing alarm sets (if any).

Each AlarmRangeSet may have a context, which indicates when its effects may be applied. Only the first matching set is applied.

An AlarmRangeSet with context None represents the *default* set of alarm ranges. There can be only one such set, and it is always applied at the end when no other set of contextual ranges is applicable.

#### Parameters

- **parameter** – Either a fully-qualified XTCE name or an alias in the format NAMESPACE/NAME.
- **sets** – List of range sets (either contextual or not)

**set\_algorithm**(parameter: *str*, text: *str*)

Change an algorithm text. Can only be performed on JavaScript or Python algorithms.

#### Parameters

- **text** – New algorithm text (as it would appear in excel or XTCE)
- **parameter** – Either a fully-qualified XTCE name or an alias in the format NAMESPACE/NAME.

**set\_calibrators**(parameter: *str*, calibrators: *List*[*Calibrator*])

Apply an ordered set of calibrators for the specified parameter. This replaces existing calibrators (if any).

Each calibrator may have a context, which indicates when its effects may be applied. Only the first matching calibrator is applied.

A calibrator with context `None` is the *default* calibrator. There can be only one such calibrator, and is always applied at the end when no other contextual calibrator was applicable.

#### Parameters

- **parameter** – Either a fully-qualified XTCE name or an alias in the format `NAMESPACE/NAME`.
- **calibrators** – List of calibrators (either contextual or not)

`set_default_alarm_ranges`(*parameter*: *str*, *watch*: *Tuple*[float | None, float | None] | None = None, *warning*: *Tuple*[float | None, float | None] | None = None, *distress*: *Tuple*[float | None, float | None] | None = None, *critical*: *Tuple*[float | None, float | None] | None = None, *severe*: *Tuple*[float | None, float | None] | None = None, *min\_violations*: *int* = 1)

Generate out-of-limit alarms for a parameter using the specified alarm ranges.

This replaces any previous default alarms on this parameter.

#### Note

Contextual range sets take precedence over the default alarm ranges. See [set\\_alarm\\_range\\_sets\(\)](#) for setting contextual range sets.

#### Parameters

- **parameter** – Either a fully-qualified XTCE name or an alias in the format `NAMESPACE/NAME`.
- **watch** – Range expressed as a tuple (`lo`, `hi`) where `lo` and `hi` are assumed exclusive.
- **warning** – Range expressed as a tuple (`lo`, `hi`) where `lo` and `hi` are assumed exclusive.
- **distress** – Range expressed as a tuple (`lo`, `hi`) where `lo` and `hi` are assumed exclusive.
- **critical** – Range expressed as a tuple (`lo`, `hi`) where `lo` and `hi` are assumed exclusive.
- **severe** – Range expressed as a tuple (`lo`, `hi`) where `lo` and `hi` are assumed exclusive.
- **min\_violations** – Minimum violations before an alarm is generated.

`set_default_calibrator`(*parameter*: *str*, *type*: *str* | None, *data*)

Apply a calibrator while processing raw values of the specified parameter. If there is already a default calibrator associated to this parameter, that calibrator gets replaced.

#### Note

Contextual calibrators take precedence over the default calibrator. See [set\\_calibrators\(\)](#) for setting contextual calibrators.

Two types of calibrators can be applied:

- Polynomial calibrators apply a polynomial expression of the form:  $y = a + bx + cx^2 + \dots$ . The *data* argument must be an array of floats [`a`, `b`, `c`, ...].

- Spline calibrators interpolate the raw value between a set of points which represent a linear curve.

The *data* argument must be an array of [x, y] points.

#### Parameters

- **parameter** – Either a fully-qualified XTCE name or an alias in the format `NAMESPACE/NAME`.
- **type** – One of `polynomial` or `spline`.
- **data** – Calibration definition for the selected type.

**set\_parameter\_value**(*parameter*: *str*, *value*: *Any*, *generation\_time*: *datetime* | *None* = *None*, *expires\_in*: *float* | *None* = *None*)

Sets the value of the specified parameter.

#### Parameters

- **parameter** – Either a fully-qualified XTCE name or an alias in the format `NAMESPACE/NAME`.
- **value** – The value to set.
- **generation\_time** – Generation time of the value. If unset, Yamcs will assign the generation time.
- **expires\_in** – How long before this value expires (in fractional seconds). If unset, the value does not expire.

Added in version 1.9.1: Compatible with Yamcs 5.8.8 onwards

**set\_parameter\_values**(*values*: *Mapping*[*str*, *Any*], *generation\_time*: *datetime* | *None* = *None*, *expires\_in*: *float* | *None* = *None*)

Sets the value of multiple parameters.

Values are specified with their native Python types. If you need to customize individual value properties, use [ValueUpdate](#) instead.

The method arguments `generation_time` and `expires_in` can be used to specify a custom generation time for all values at once. This has lower priority than value-specific properties.

If no generation time is specified at all, Yamcs will determine one.

#### Parameters

- **values** – Values keyed by parameter name. This name can be either a fully-qualified XTCE name or an alias in the format `NAMESPACE/NAME`.
- **generation\_time** – Generation time of the values.
- **expires\_in** – How long before this value expires (in fractional seconds).

Added in version 1.9.1: Compatible with Yamcs 5.8.8 onwards

**shelve\_alarm**(*alarm*: *str*, *sequence\_number*: *int*, *comment*: *str* | *None* = *None*)

Shelve an alarm.

#### Parameters

- **alarm** – Alarm name
- **sequence\_number** – Sequence number
- **comment** – Optional comment to associate with the state change.

`unshelve_alarm(alarm: str, sequence_number: int, comment: str | None = None)`

Unshelve an alarm.

#### Parameters

- **alarm** – Alarm name
- **sequence\_number** – Sequence number
- **comment** – Optional comment to associate with the state change.

`class yamcs.client.CommandConnection(manager, tmtc_client: ProcessorClient)`

Bases: [WebSocketSubscriptionFuture](#)

Local object providing access to the acknowledgment progress of command updates.

Only commands issued from this object are monitored.

Initializes the future. Should not be called by clients.

`issue(command: str, args: Mapping[str, Any] | None = None, *, dry_run: bool = False, comment: str | None = None, verification: VerificationConfig | None = None, stream: str | None = None, extra: Mapping[str, Any] | None = None, sequence_number: int | None = None) → MonitoredCommand`

Issue the given command

#### Parameters

- **command** – Either a fully-qualified XTCE name or an alias in the format `NAMESPACE/NAME`.
- **args** – Named arguments (if the command requires these).
- **dry\_run** – If True the command is not actually issued. This can be used to test if the server would generate errors when preparing the command (for example because an argument is missing).
- **comment** – Comment attached to the command.
- **verification** – Overrides to the default verification handling of this command.
- **stream** – Override the stream on which the command should be sent out.

Added in version 1.9.6.

- **extra** – Extra command options for interpretation by non-core extensions (custom preprocessor, datalinks, command listeners). Note that Yamcs will refuse command options that it does not know about. Extensions should therefore register available options.
- **sequence\_number** – Sequence number of this command. This is used to determine unicity of commands at the same time and coming from the same origin. If not set Yamcs will automatically assign a sequential number as if every submitted command is unique.

Added in version 1.9.0.

#### Returns

An object providing access to properties of the newly issued command and updated according to command history updates.

`class yamcs.client.AlarmSubscription(manager)`

Bases: [WebSocketSubscriptionFuture](#)

Local object representing an alarm subscription.

A subscription object stores the currently active alarms.

Initializes the future. Should not be called by clients.

`get_alarm(name: str) → Alarm`

Returns the alarm state associated with a specific named alarm from local cache.

**Parameters**

**name** – Fully-qualified name

`list_alarms() → List[Alarm]`

Returns a snapshot of all active alarms.

**class** `yamcs.client.CommandHistorySubscription(manager: WebSocketSubscriptionManager)`

Bases: [WebSocketSubscriptionFuture](#)

Local object providing access to command history updates.

This object buffers all received command history. This is needed to stitch together incremental command history events.

If you expect to receive a lot of command history updates you should periodically clear local cache via `clear_cache()`. In future work, we may add automated buffer management within configurable watermarks.

**Warning**

If command history updates are received for commands that are not currently in the local cache, the returned information may be incomplete.

Initializes the future. Should not be called by clients.

`clear_cache()`

Clears local command history cache.

`get_command_history(issued_command: IssuedCommand) → CommandHistory | None`

Gets locally cached CommandHistory for the specified command.

**Parameters**

**issued\_command** – object representing a previously issued command.

**class** `yamcs.client.ContainerSubscription(manager: WebSocketSubscriptionManager)`

Bases: [WebSocketSubscriptionFuture](#)

Local object providing access to container updates

Initializes the future. Should not be called by clients.

`get_container(name: str) → ContainerData`

Returns the latest container of a specific name.

**Parameters**

**name** – Container name

`list_containers() → List[ContainerData]`

Returns the latest container for each name.

**class** `yamcs.client.ParameterSubscription(manager: WebSocketSubscriptionManager)`

Bases: [WebSocketSubscriptionFuture](#)

Local object representing a subscription of zero or more parameters.

A subscription object stores the last received value of each subscribed parameter.

Initializes the future. Should not be called by clients.

`add(parameters: str | List[str], abort_on_invalid: bool = True, send_from_cache: bool = True)`

Add one or more parameters to this subscription.

#### Parameters

- **parameters** – Parameter(s) to be added
- **abort\_on\_invalid** – If True one invalid parameter means any other parameter in the request will also not be added to the subscription.
- **send\_from\_cache** – If True the last processed parameter value is sent from parameter cache. When False only newly processed parameters are received.

`await_first_delivery(timeout: float | None = None)`

Wait for the first update of parameter values.

#### Parameters

**timeout** – The amount of seconds to wait.

`delivery_count: int`

The number of parameter deliveries.

`get_value(parameter: str)`

Returns the last value of a specific parameter from local cache.

#### Parameters

**parameter** – Parameter name.

`remove(parameters: str | List[str])`

Remove one or more parameters from this subscription.

#### Parameters

**parameters** – Parameter(s) to be removed

`value_cache: Dict[str, ParameterValue]`

Value cache keyed by parameter name.

### 3.1.2 Model

```
class yamcs.client.Acknowledgment(name, time, status, message)
```

Bases: `object`

`is_terminated()`

`message`

Message of this acknowledgment.

`name`

Name of this acknowledgment.

`status`

Status of this acknowledgment.

`time`

Last update time of this acknowledgment.

```
class yamcs.client.Alarm(proto)
```

Bases: `ABC`

`property acknowledge_message: str | None`

Comment provided when acknowledging the alarm.

`property acknowledge_time: datetime | None`

Processor time when the alarm was acknowledged.

**property acknowledged\_by:** `str` | `None`

Username of the acknowledger.

**property count:** `int`

Total number of samples while this alarm is active.

**property is\_acknowledged:** `bool`

True if this alarm has been acknowledged.

**property is\_latched:** `bool`

True if this alarm is currently latched.

**property is\_latching:** `bool`

True if this is a latching alarm. A latching alarm returns to normal only when the operator resets it

**property is\_ok:** `bool`

True if this alarm is currently 'inactive'.

For a non-latching alarm this is identical to `is_process_ok()`. A latching alarm is only OK if it has returned to normal and was acknowledged.

**property is\_process\_ok:** `bool`

True if the process that caused this alarm is OK. For example: parameter back within limits.

For a non-latching alarm this is identical to `is_ok()`.

**property is\_shelved:** `bool`

True if this alarm has been shelved.

**property name:** `str`

Fully-qualified name of the source of this alarm.

**property sequence\_number:** `int`

Sequence number for this specific alarm instance. This allows ensuring that operations (such as acknowledgment) are done on the expected alarm instance.

**property severity:** `str`

**property trigger\_time:** `datetime`

Processor time when the alarm was triggered.

**property update\_time:** `datetime`

Processor time when the alarm was last updated.

**property violation\_count:** `int`

Number of violating samples while this alarm is active.

```
class yamcs.client.AlarmRangeSet(context: str, watch: Tuple[float | None, float | None] | None = None,
                                warning: Tuple[float | None, float | None] | None = None, distress:
                                Tuple[float | None, float | None] | None = None, critical: Tuple[float |
                                None, float | None] | None = None, severe: Tuple[float | None, float
                                | None] | None = None, min_violations: int = 1)
```

Bases: `object`

A set of alarm ranges that apply in a specific context.

#### Parameters

- **context** – Condition under which this range set is applicable. The value `None` indicates the default range set which is only applicable if no contextual sets match.
- **watch** – Range expressed as a tuple (`lo`, `hi`) where `lo` and `hi` are assumed exclusive.

- **warning** – Range expressed as a tuple (lo, hi) where lo and hi are assumed exclusive.
- **distress** – Range expressed as a tuple (lo, hi) where lo and hi are assumed exclusive.
- **critical** – Range expressed as a tuple (lo, hi) where lo and hi are assumed exclusive.
- **severe** – Range expressed as a tuple (lo, hi) where lo and hi are assumed exclusive.
- **min\_violations** – Minimum violations before an alarm is generated.

`class yamcs.client.AlarmUpdate(proto)`

Bases: `object`

Object received through callbacks when subscribing to alarm updates.

**property alarm:** `Alarm`

Latest alarm state.

**property update\_type:** `str`

Type of update.

`class yamcs.client.Calibrator(context: str, type: str, data)`

Bases: `object`

A calibrator that may be applied to a numeric raw value.

Two types of calibrators can be applied:

- **Polynomial calibrators apply a polynomial expression of the form:**

$$y = a + bx + cx^2 + \dots$$

The *data* argument must be an array of floats [a, b, c, ...].

- **Spline calibrators interpolate the raw value between a set of points** which represent a linear curve.

The *data* argument must be an array of [x, y] points.

#### Parameters

- **context** – Condition under which this calibrator may be applied. The value `None` indicates the default calibrator which is only applied if no contextual calibrators match.
- **type** – One of `polynomial` or `spline`.
- **data** – Calibration definition for the selected type.

`POLYNOMIAL = 'polynomial'`

`SPLINE = 'spline'`

`class yamcs.client.CommandHistory(proto)`

Bases: `object`

**property acknowledgments:** `Dict[str, Acknowledgment]`

All acknowledgments by name.

#### Returns

Acknowledgments keyed by name.

**property aliases:** `Dict[str, str]`

Aliases, keyed by namespace

Added in version 1.9.2: Compatible with Yamcs 5.8.4 onwards

**property all\_assignments:** `Dict[str, Any]`

Argument assignments by name.

Added in version 1.9.2.

**property assignments:** `Dict[str, Any]`

Argument assignments by name.

This returns only explicit assignments set by the command issuer. To return all assignments, including ones that use their default values, use `all_assignments` instead.

Added in version 1.9.2.

**property binary**

Binary representation of the command.

**property comment:** `str | None`

Optional user comment attached when issuing the command.

**property error:** `str | None`

Error message in case the command failed.

**generation\_time:** `datetime`

The generation time as set by Yamcs

**property id:** `str`

A unique identifier for this command.

**is\_complete()** → `bool`

Returns whether this command is complete. A command can be completed, yet still failed.

**is\_failure()** → `bool`

Returns True if the command has completed, but failed.

**is\_success()** → `bool`

Returns True if the command has completed successfully.

**property name:** `str`

Name of the command.

**property origin:** `str | None`

The origin of this command. Usually the IP address of the issuer.

**property sequence\_number:** `int`

The sequence number of this command. This is the sequence number assigned by the issuing client.

**property source:** `str`

String representation of the command.

**property unprocessed\_binary**

Binary representation before postprocessing.

Added in version 1.9.2.

**property username:** `str | None`

Username of the issuer.

**class** `yamcs.client.ContainerData(proto)`

Bases: `object`

**property binary**

Raw binary

**property generation\_time:** `datetime`

The time when this container's packet was generated (packet time).

**property name:** `str`

The name of the container.

**property reception\_time:** `datetime`

The time when this container's packet was received by Yamcs.

**class** `yamcs.client.EventAlarm(proto)`

Bases: `Alarm`

An alarm triggered by an event.

**property current\_event:** `Event`

Latest event for this alarm

**property most\_severe\_event:** `Event`

First event that invoked the highest severity level of this alarm

**property trigger\_event:** `Event`

Event that originally triggered the alarm

**class** `yamcs.client.IssuedCommand(proto)`

Bases: `object`

**property aliases:** `Dict[str, str]`

Aliases, keyed by namespace

Added in version 1.9.2: Compatible with Yamcs 5.8.4 onwards

**property all\_assignments:** `Dict[str, Any]`

Argument assignments by name.

Added in version 1.9.2.

**property assignments:** `Dict[str, Any]`

Argument assignments by name.

This returns only explicit assignments set by the command issuer. To return all assignments, including ones that use their default values, use `all_assignments` instead.

Added in version 1.9.2.

**property binary**

Binary representation of this command.

**property generation\_time:** `datetime`

The generation time as set by Yamcs.

**property hex**

Hexadecimal string representation of this command.

**property id:** `str`

A unique identifier for this command.

**property name:** `str`

The fully-qualified name of this command.

**property origin:** `str | None`

The origin of this command. Usually the IP address of the issuer.

**property queue:** `str | None`

The name of the queue that this command was assigned to.

**property sequence\_number**

The sequence number of this command. This is the sequence number assigned by the issuing client.

**property source**

String representation of this command.

**property unprocessed\_binary**

Binary representation before postprocessing.

**property username: str**

The username of the issuer.

**class** `yamcs.client.MonitoredCommand(proto)`

Bases: [IssuedCommand](#)

Represent an instance of an issued command that is updated throughout the acknowledgment process.

Objects of this class are owned by a [CommandConnection](#) instance.

**property acknowledgments: Dict[str, Acknowledgment]**

All acknowledgments by name.

**Returns**

Acknowledgments keyed by name.

**property attributes: Dict[str, Any]**

**await\_acknowledgment(name: str, timeout: float | None = None) → Acknowledgment**

Waits for the result of a specific acknowledgment.

**Parameters**

- **name** – The name of the acknowledgment. Standard names are `Acknowledge_Queued`, `Acknowledge_Released` and `Acknowledge_Sent`. Others depend on specific link types.
- **timeout** – The amount of seconds to wait.

**await\_complete(timeout: float | None = None)**

Wait for the command to be *completed*. Afterwards use [is\\_success\(\)](#) or [is\\_failure\(\)](#) to determine whether the command was successful or not.

**Note**

Yamcs cannot determine completion unless the command has an appropriate verifier configured in the Yamcs MDB.

When no such verifier is present, this method will never return (or timeout).

**Parameters**

**timeout** – The amount of seconds to wait.

**property comment: str | None**

Optional user comment attached when issuing the command.

**property error: str | None**

Error message in case the command failed.

This information is only available when the command has failed to complete. ([is\\_failure\(\)](#) returns *True*).

**is\_complete()** → **bool**

Returns whether this command is complete. A command can be completed, yet still failed.

Use `await_complete()` to wait until this information is available.

**is\_failure()** → **bool**

Returns True if the command has completed, but failed.

Use `await_complete()` to wait until this information is available.

**is\_success()** → **bool**

Returns True if this command was completed successfully.

Use `await_complete()` to wait until this information is available.

**class** `yamcs.client.Packet`(*proto*)

Bases: `object`

**property** `binary`: `bytes`

Raw binary of this packet

**property** `earth_reception_time`: `datetime` | `None`

When the signal was received on the ground.

Added in version 1.9.1.

**property** `generation_time`: `datetime`

The time when the packet was generated (packet time).

**property** `link`: `str`

Name of the Yamcs link where this packet was received from.

Added in version 1.9.1.

**property** `name`: `str`

The name of the packet. When using XTCE extraction this is the fully-qualified name of the first container in the hierarchy that this packet maps to.

**property** `reception_time`: `datetime`

The time when the packet was received by Yamcs.

**property** `sequence_number`: `int`

The sequence number of the packet. This is usually decoded from the packet.

**property** `size`: `int`

Size in bytes of this packet

**class** `yamcs.client.ParameterAlarm`(*proto*)

Bases: `Alarm`

An alarm triggered by a parameter that went out of limits.

**property** `current_value`: `ParameterValue`

Latest parameter value for this alarm.

**property** `most_severe_value`: `ParameterValue`

First parameter value that invoked the highest severity level of this alarm.

**property** `trigger_value`: `ParameterValue`

Parameter value that originally triggered the alarm

**class** `yamcs.client.ParameterData`(*proto*, *mapping=None*)

Bases: `object`

`get_value(parameter: str) → ParameterValue | None`

Returns the value of a specific parameter. Or None if the parameter is not included in this update.

#### Parameters

**parameter** – Parameter name.

**property parameters:** `List[ParameterValue]`

`class yamcs.client.ParameterValue(proto, id=None)`

Bases: `object`

**property eng\_value**

The engineering (calibrated) value.

**property generation\_time:** `datetime`

The time when the parameter was generated. If the parameter was extracted from a packet, this usually returns the packet time.

**property monitoring\_result:** `str`

**property name:** `str`

An identifying name for the parameter value. Typically this is the fully-qualified XTCE name, but it may also be an alias depending on how the parameter update was requested.

**property range\_condition:** `str | None`

If the value is out of limits, this indicates LOW or HIGH.

**property raw\_value**

The raw (uncalibrated) value.

**property reception\_time:** `datetime | None`

The time when the parameter value was received by Yamcs.

**property validity\_duration:** `timedelta | None`

How long this parameter value is valid.

**property validity\_status:** `str`

`class yamcs.client.ValueUpdate(value: Any, generation_time: datetime | None = None, expires_in: float | None = None)`

Bases: `object`

Data holder for passing a value along with its generation time when updating a software parameter.

#### Parameters

- **value** – The value to set
- **generation\_time** – Generation time of the value. If unset, Yamcs will assign the generation time.
- **expires\_in** – How long before this value expires (in fractional seconds). If unset, the value does not expire.

Added in version 1.9.1: Compatible with Yamcs 5.8.8 onwards

`class yamcs.client.VerificationConfig`

Bases: `object`

Contains overrides to the default verification handling of Yamcs.

**disable(verifier: str | None = None)**

Disable verification.

### Parameters

**verifier** – Name of a specific verifier to disable. If unspecified all verifiers are disabled.

**modify\_check\_window**(*verifier*: *str*, *start*: *float* | *None* = *None*, *stop*: *float* | *None* = *None*)

Set or override the check window.

Depending on the Mission Database configuration, the time may be relative to either the command release or a preceding verifier.

### Parameters

- **verifier** – Name of the verifier
- **start** – Window start time (relative, in seconds)
- **stop** – Window stop time (relative, in seconds)

## 3.2 Snippets

Create a [ProcessorClient](#) for a specific processor:

```
from yamcs.client import YamcsClient

client = YamcsClient('localhost:8090')
processor = client.get_processor(instance='simulator', processor='realtime')
```

### 3.2.1 Read/Write Parameters

Read a single value. This returns the latest value from server cache.

```
pval = processor.get_parameter_value("/YSS/SIMULATOR/BatteryVoltage1")
print(pval)
```

Read a single value, but block until a fresh value could be processed:

```
pval = processor.get_parameter_value(
    "/YSS/SIMULATOR/BatteryVoltage2", from_cache=False, timeout=5
)
print(pval)
```

Read the latest value of multiple parameters at the same time:

```
pvals = processor.get_parameter_values(
    ["/YSS/SIMULATOR/BatteryVoltage1", "/YSS/SIMULATOR/BatteryVoltage2"]
)
print("battery1", pvals[0])
print("battery2", pvals[1])
```

Set the value of a parameter. Only some types of parameters can be written to. This includes software parameters (local to Yamcs) and parameters that are linked to an external system (such as a simulator).

```
processor.set_parameter_value("/YSS/SIMULATOR/AllowCriticalTC1", True)
```

Set the value of multiple parameters:

```
processor.set_parameter_values(
    {
        "/YSS/SIMULATOR/AllowCriticalTC1": False,
        "/YSS/SIMULATOR/AllowCriticalTC2": False,
    }
)
```

### 3.2.2 Parameter Subscription

Poll latest values from a subscription:

```
subscription = processor.create_parameter_subscription(
    ["/YSS/SIMULATOR/BatteryVoltage1"]
)

sleep(5)
print("Latest value:")
print(subscription.get_value("/YSS/SIMULATOR/BatteryVoltage1"))

sleep(5)
print("Latest value:")
print(subscription.get_value("/YSS/SIMULATOR/BatteryVoltage1"))
```

Receive *ParameterData* callbacks whenever one or more of the subscribed parameters have been updated:

```
def print_data(data):
    for parameter in data.parameters:
        print(parameter)

processor.create_parameter_subscription(
    "/YSS/SIMULATOR/BatteryVoltage1", on_data=print_data
)
sleep(5) # Subscription is non-blocking
```

Create and modify a parameter subscription:

```
subscription = processor.create_parameter_subscription(
    ["/YSS/SIMULATOR/BatteryVoltage1"]
)

sleep(5)

print("Adding extra items to the existing subscription...")
subscription.add(
    [
        "/YSS/SIMULATOR/Alpha",
        "/YSS/SIMULATOR/BatteryVoltage2",
        "MDB:OPS Name/SIMULATOR_PrimBusVoltage1",
    ]
)

sleep(5)

print("Shrinking subscription...")
subscription.remove("/YSS/SIMULATOR/Alpha")

print("Cancelling the subscription...")
subscription.cancel()

print("Last values from cache:")
print(subscription.get_value("/YSS/SIMULATOR/BatteryVoltage1"))
print(subscription.get_value("/YSS/SIMULATOR/BatteryVoltage2"))
print(subscription.get_value("/YSS/SIMULATOR/Alpha"))
print(subscription.get_value("MDB:OPS Name/SIMULATOR_PrimBusVoltage1"))
```

### 3.2.3 Commanding

Issue a command (fire-and-forget):

```
command = processor.issue_command(
    "/YSS/SIMULATOR/SWITCH_VOLTAGE_OFF", args={"voltage_num": 1}
)
print("Issued", command)
```

To monitor acknowledgments, establish a command connection first. Commands issued from this connection are automatically updated with progress status:

```

conn = processor.create_command_connection()

command = conn.issue("/YSS/SIMULATOR/SWITCH_VOLTAGE_OFF", args={"voltage_num": 1})

ack = command.await_acknowledgment("Acknowledge_Sent")
print(ack.status)

```

The default Yamcs-local acknowledgments are:

- Acknowledge\_Queued
- Acknowledge\_Released
- Acknowledge\_Sent

Custom telemetry verifiers or command links may cause additional acknowledgments to be generated.

If configured, command completion can also be monitored:

```

conn = processor.create_command_connection()

command1 = conn.issue("/YSS/SIMULATOR/SWITCH_VOLTAGE_OFF", args={"voltage_num": 1})

# Issue 2nd command only if the previous command was completed successfully.
command1.await_complete()
if command1.is_success():
    conn.issue("/YSS/SIMULATOR/SWITCH_VOLTAGE_ON", args={"voltage_num": 1})
else:
    print("Command 1 failed:", command1.error)

```

### 3.2.4 Alarm Monitoring

Receive [AlarmUpdate](#) callbacks:

```

def callback(alarm_update):
    print("Alarm Update:", alarm_update)

processor.create_alarm_subscription(callback)

```

Acknowledge all active alarms:

```

for alarm in processor.list_alarms():
    if not alarm.is_acknowledged:
        processor.acknowledge_alarm(
            alarm.name,
            alarm.sequence_number,
            comment="false alarm",
        )

```

### 3.2.5 Run a Script

Run a custom script. The script has to be known by Yamcs. By default, this is done by placing an executable file in the etc/scripts/ directory of Yamcs.

Scripts have access to special environment variables YAMCS\_URL, YAMCS\_API\_KEY, YAMCS\_INSTANCE and YAMCS\_PROCESSOR, which is used by [YamcsClient.from\\_environment\(\)](#)

```

# Simulate LOS for 5 seconds
# (the run_script call does not block)
processor.run_script("simulate_los.py", "--duration 5")

```

### etc/scripts/simulate\_los.sh

```
#!/usr/bin/env -S python3 -u

import argparse
import os
import time

from yamcs.client import YamcsClient

parser = argparse.ArgumentParser()
parser.add_argument("-d", "--duration", type=float, default=60)
args = parser.parse_args()

client = YamcsClient.from_environment()
processor = client.get_processor(
    instance=os.environ["YAMCS_INSTANCE"],
    processor=os.environ["YAMCS_PROCESSOR"],
)

print("Starting LOS")
processor.issue_command("/TSE/simulator/start_los")
time.sleep(args.duration)

print("Stopping LOS")
processor.issue_command("/TSE/simulator/stop_los")
```

Notice the use of `-u` in the shebang. This disables Python output buffering, so that print statements are immediately seen.

## 4. Archive

The Archive API provides methods that you can use to programmatically retrieve the content of a Yamcs Archive.

### 4.1 Reference

#### 4.1.1 Client

##### Note

ArchiveClient instances are usually created via `YamcsClient.get_archive()`:

```
from yamcs.client import YamcsClient

client = YamcsClient('localhost:8090')
archive = client.get_archive(instance='simulator')
# ...
```

`class yamcs.client.ArchiveClient(ctx: Context, instance: str)`

`create_stream_subscription(stream: str, on_data: Callable[[StreamData], None], timeout: float = 60) → WebSocketSubscriptionFuture`

Create a new stream subscription.

##### Parameters

- **stream** – The name of the stream.
- **on\_data** – Function that gets called with `StreamData` updates.
- **timeout** – The amount of seconds to wait for the request to complete.

##### Returns

Future that can be used to manage the background websocket subscription.

`disable_parameter_archive_backfilling()`

Disables the automatic backfilling (rebuilding) of the parameter archive.

If the backfilling is already disabled, this operation has no effect.

`downsample_mean(parameter: str, start: datetime | None = None, stop: datetime | None = None, *, sample_count: int = 500, parameter_cache: str = 'realtime', source: str = 'ParameterArchive') → List[MeanSample]`

Downsample parameter values in the requested range using averaging (mean).

The query range is split in sample intervals of equal length. For each interval a `MeanSample` is returned which describes the min, max, count and avg during that interval.

Note that sample times are determined without considering the actual parameter values. Two separate queries with equal start/stop arguments will always return the same number of samples

with the same timestamps. This is done to ease merging of multiple sample series. You should always be explicit about the `start` and `stop` times when relying on this property.

#### Parameters

- **parameter** – Either a fully-qualified XTCE name or an alias in the format `NAMESPACE/NAME`.
- **start** – Minimum generation time of the sampled parameter values (inclusive). If not set this defaults to one hour ago.
- **stop** – Maximum generation time of the sampled parameter values (exclusive). If not set this defaults to the current time.
- **sample\_count** – The number of returned samples.
- **parameter\_cache** – Specify the name of the processor who's parameter cache is merged with already archived values. To disable results from the parameter cache, set this to `None`.
- **source** – Specify how to retrieve parameter values. By default this uses the `ParameterArchive` which is optimized for retrieval. For Yamcs instances that do not enable the `ParameterArchive`, you can still get results by specifying `replay` as the source. Replay requests take longer to return because the data needs to be reprocessed.

`dump_table(table: str, query: str | None = None, chunk_size: int = 32768)`

`enable_parameter_archive_backfilling()`

Enables the automatic backfilling (rebuilding) of the parameter archive.

If the backfilling is already enabled, this operation has no effect.

`execute_sql(statement: str) → ResultSet`

Executes a single SQL statement.

#### Parameters

**statement** – SQL string

#### Returns

A result set for consuming rows

`export_commands(start: datetime | None = None, stop: datetime | None = None, chunk_size: int = 32768) → Iterable`

Export command history.

Commands are sorted by generation time, origin and sequence number.

#### Parameters

- **start** – Minimum generation time of the returned commands (inclusive)
- **stop** – Maximum generation time of the returned commands (exclusive)

#### Returns

An iterator over received chunks

`export_packets(name: str | None = None, start: datetime | None = None, stop: datetime | None = None, chunk_size: int = 32768) → Iterable`

Export raw packets.

Packets are sorted by generation time and sequence number.

#### Parameters

- **name** – Archived name of the packet
- **start** – Minimum generation time of the returned packets (inclusive)

- **stop** – Maximum generation time of the returned packets (exclusive)

#### Returns

An iterator over received chunks

**export\_parameter\_values**(*parameters*: List[str], \*, *namespace*: str | None = None, *start*: datetime | None = None, *stop*: datetime | None = None, *interval*: float | None = None, *chunk\_size*: int = 32768, *source*: str = 'ParameterArchive') → Iterable

Export parameter values in CSV format.

#### Parameters

- **parameters** – List of parameter names. These may be fully-qualified XTCE name or an alias in the format NAMESPACE/NAME.
- **namespace** – Preferred namespace of the names in the returned CSV header
- **start** – Minimum generation time of the returned values (inclusive)
- **stop** – Maximum generation time of the returned values (exclusive)
- **interval** – If specified, only one value for each interval is returned. The interval is expressed in seconds.
- **source** – Specify how to retrieve parameter values. By default this uses the ParameterArchive which is optimized for parameter retrieval. For Yamcs instances that do not enable the ParameterArchive, you can still get results by specifying replay as the source. Replay requests take longer to return because the packet data needs to be reprocessed.

Added in version 1.13.0: Compatible with Yamcs v5.12.6 onwards

#### Returns

An iterator over received chunks

**get\_packet**(*generation\_time*: datetime, *sequence\_number*: int, *partition*: str | None = None) → Packet

Gets a single packet by its identifying key (partition, gentime, seqNum).

#### Parameters

- **generation\_time** – When the packet was generated (packet time)
- **sequence\_number** – Sequence number of the packet
- **partition** – Packet partition name. This property works only against recent versions of Yamcs, and will become required in the future (it was erroneously omitted).

**get\_stream**(*stream*: str) → Stream

Gets a single stream.

#### Parameters

**stream** – The name of the stream.

**get\_table**(*table*: str) → Table

Gets a single table.

#### Parameters

**table** – The name of the table.

**list\_alarms**(*name*: str | None = None, *start*: datetime | None = None, *stop*: datetime | None = None, *page\_size*: int = 500, *descending*: bool = False) → Iterable[Alarm]

Reads alarm information between the specified start and stop time.

Alarms are sorted by trigger time, name and sequence number.

#### Parameters

- **name** – Filter by alarm name
- **start** – Minimum trigger time (inclusive)
- **stop** – Maximum trigger time (exclusive)
- **page\_size** – Page size of underlying requests. Higher values imply less overhead, but risk hitting the maximum message size limit.
- **descending** – If set to True alarms are fetched in reverse order (most recent first).

**list\_command\_histogram**(*name*: *str* | *None* = *None*, *start*: *datetime* | *None* = *None*, *stop*: *datetime* | *None* = *None*, *merge\_time*: *float* = 2) → *Iterable*[*IndexGroup*]

Reads command-related index records between the specified start and stop time.

Each iteration returns a chunk of chronologically-sorted records.

#### Parameters

**merge\_time** – Maximum gap in seconds before two consecutive index records are merged together.

**list\_command\_history**(*command*: *str* | *None* = *None*, *queue*: *str* | *None* = *None*, *start*: *datetime* | *None* = *None*, *stop*: *datetime* | *None* = *None*, *page\_size*: *int* = 500, *descending*: *bool* = *False*) → *Iterable*[*CommandHistory*]

Reads command history entries between the specified start and stop time.

#### Note

This method will send out multiple requests when more than `page_size` commands are queried. For large queries, consider using `stream_command_history()` instead, it uses server-streaming based on a single request.

#### Parameters

- **command** – Either a fully-qualified XTCE name or an alias in the format `NAMESPACE/NAME`.
- **queue** – Name of the queue that the command was assigned to.
- **start** – Minimum generation time of the returned command history entries (inclusive)
- **stop** – Maximum generation time of the returned command history entries (exclusive)
- **page\_size** – Page size of underlying requests. Higher values imply less overhead, but risk hitting the maximum message size limit.
- **descending** – If set to True results are fetched in reverse order (most recent first).

**list\_completeness\_index**(*start*: *datetime* | *None* = *None*, *stop*: *datetime* | *None* = *None*, *merge\_time*: *float* = 2) → *Iterable*[*IndexGroup*]

Reads completeness index records between the specified start and stop time.

Each iteration returns a chunk of chronologically-sorted records.

#### Parameters

**merge\_time** – Maximum gap in seconds before two consecutive index records are merged together.

**list\_event\_histogram**(*source*: *str* | *None* = *None*, *start*: *datetime* | *None* = *None*, *stop*: *datetime* | *None* = *None*, *merge\_time*: *float* = 2) → *Iterable*[*IndexGroup*]

Reads event-related index records between the specified start and stop time.

Each iteration returns a chunk of chronologically-sorted records.

### Parameters

**merge\_time** – Maximum gap in seconds before two consecutive index records are merged together.

**list\_event\_sources()** → [Iterable\[str\]](#)

Returns the existing event sources.

**list\_events**(*source: str | None = None, severity: str | None = None, text\_filter: str | None = None, filter: str | None = None, start: datetime | None = None, stop: datetime | None = None, page\_size: int = 500, descending: bool = False*) → [Iterable\[Event\]](#)

Reads events between the specified start and stop time.

Events are sorted by generation time, source, then sequence number.

### **i** Note

This method will send out multiple requests when more than `page_size` events are queried. For large queries, consider using [stream\\_events\(\)](#) instead, it uses server-streaming based on a single request.

### Parameters

- **source** – The source of the returned events.
- **severity** – The minimum severity level of the returned events. One of INFO, WATCH, WARNING, DISTRESS, CRITICAL or SEVERE.
- **text\_filter** – Filter the text message of the returned events
- **filter** – Filter query, allows for both text and field search.  
Added in version 1.10.1: Compatible with Yamcs v5.10.2 onwards
- **start** – Minimum start date of the returned events (inclusive)
- **stop** – Maximum start date of the returned events (exclusive)
- **page\_size** – Page size of underlying requests. Higher values imply less overhead, but risk hitting the maximum message size limit.
- **descending** – If set to True events are fetched in reverse order (most recent first).

**list\_packet\_histogram**(*name: str | None = None, start: datetime | None = None, stop: datetime | None = None, merge\_time: float = 2*) → [Iterable\[IndexGroup\]](#)

Reads packet-related index records between the specified start and stop time.

Each iteration returns a chunk of chronologically-sorted records.

### Parameters

**merge\_time** – Maximum gap in seconds before two consecutive index records are merged together.

**list\_packet\_names()** → [Iterable\[str\]](#)

Returns the existing packet names.

**list\_packets**(*name: str | None = None, filter: str | None = None, start: datetime | None = None, stop: datetime | None = None, page\_size: int = 500, descending: bool = False*) → [Iterable\[Packet\]](#)

Reads packet information between the specified start and stop time.

Packets are sorted by generation time and sequence number.

### **Note**

This method will send out multiple requests when more than `page_size` packets are queried. For large queries, consider using `stream_packets()` instead, it uses server-streaming based on a single request.

### Parameters

- **name** – Archived name of the packet
- **filter** – Filter query, allows for both text and field search.  
Added in version 1.12.0: Compatible with Yamcs v5.12.0 onwards
- **start** – Minimum generation time of the returned packets (inclusive)
- **stop** – Maximum generation time of the returned packets (exclusive)
- **page\_size** – Page size of underlying requests. Higher values imply less overhead, but risk hitting the maximum message size limit.
- **descending** – If set to `True` packets are fetched in reverse order (most recent first).

```
list_parameter_ranges(parameter: str, start: datetime | None = None, stop: datetime | None = None, min_gap: float | None = None, max_gap: float | None = None, min_range: float | None = None, max_values: int = 100, parameter_cache: str = 'realtime') → List[ParameterRange]
```

Returns parameter ranges between the specified start and stop time.

Each range indicates an interval during which this parameter's value was uninterrupted and unchanged.

Ranges are a good fit for retrieving the value of a parameter that does not change frequently. For example an on/off indicator or some operational status. Querying ranges will then induce much less overhead than manually processing the output of `list_parameter_values()` would.

The maximum number of returned ranges is limited to 500.

### Parameters

- **parameter** – Either a fully-qualified XTCE name or an alias in the format `NAMESPACE/NAME`.
- **start** – Minimum generation time of the considered values (inclusive)
- **stop** – Maximum generation time of the considered values (exclusive)
- **min\_gap** – Time in seconds. Any gap (detected based on parameter expiration) smaller than this will be ignored. However if the parameter changes value, the ranges will still be split.
- **max\_gap** – Time in seconds. If the distance between two subsequent parameter values is bigger than this value (but smaller than the parameter expiration), then an artificial gap is created. This also applies if there is no expiration defined for the parameter.
- **min\_range** – Time in seconds. Minimum duration of returned ranges. If multiple values occur within the range, the most frequent can be accessed using the `entries` property.
- **max\_values** – Maximum number of unique values, tallied across the full requested range. Use this in combination with `min_range` to further optimize for transfer size. This value is limited to 100 at most.

- **parameter\_cache** – Specify the name of the processor who's parameter cache is merged with already archived values. To disable results from the parameter cache, set this to `None`.

`list_parameter_values`(*parameter*: *str*, *start*: *datetime* | *None* = *None*, *stop*: *datetime* | *None* = *None*, *page\_size*: *int* = 500, *descending*: *bool* = *False*, *parameter\_cache*: *str* = 'realtime', *source*: *str* = 'ParameterArchive') → `Iterable[ParameterValue]`

Reads parameter values between the specified start and stop time.

#### Note

This method will send out multiple requests when more than `page_size` values are queried. For large queries, consider using `stream_parameter_values()` instead, it uses server-streaming based on a single request, and supports downloading the values of multiple parameter at the same time.

#### Parameters

- **parameter** – Either a fully-qualified XTCE name or an alias in the format `NAMESPACE/NAME`.
- **start** – Minimum generation time of the returned values (inclusive)
- **stop** – Maximum generation time of the returned values (exclusive)
- **page\_size** – Page size of underlying requests. Higher values imply less overhead, but risk hitting the maximum message size limit.
- **descending** – If set to `True` values are fetched in reverse order (most recent first).
- **parameter\_cache** – Specify the name of the processor who's parameter cache is merged with already archived values. To disable results from the parameter cache, set this to `None`.
- **source** – Specify how to retrieve parameter values. By default this uses the `ParameterArchive` which is optimized for retrieval. For Yamcs instances that do not enable the `ParameterArchive`, you can still get results by specifying `replay` as the source. Replay requests take longer to return because the data needs to be reprocessed.

`list_processed_parameter_group_histogram`(*group*: *str* | *None* = *None*, *start*: *datetime* | *None* = *None*, *stop*: *datetime* | *None* = *None*, *merge\_time*: *float* = 20) → `Iterable[IndexGroup]`

Reads index records related to processed parameter groups between the specified start and stop time.

Each iteration returns a chunk of chronologically-sorted records.

#### Parameters

- **merge\_time** – Maximum gap in seconds before two consecutive index records are merged together.

`list_processed_parameter_groups`() → `Iterable[str]`

Returns the existing parameter groups.

`list_streams`() → `Iterable[Stream]`

Returns the existing streams.

Streams are returned in lexicographical order.

**list\_tables()** → [Iterable\[Table\]](#)

Returns the existing tables.

Tables are returned in lexicographical order.

**load\_table**(*table*: [str](#), *data*, *chunk\_size*: [int](#) = 32768) → [int](#)

**purge\_parameter\_archive()**

Removes all Parameter Archive data and related metadata.

Afterwards, use [rebuild\\_parameter\\_archive\(\)](#) to rebuild the Parameter Archive.

**rebuild\_ccsds\_index**(*start*: [datetime](#) | [None](#) = [None](#), *stop*: [datetime](#) | [None](#) = [None](#))

Rebuilds the CCSDS index. This is only applicable to projects that use a `CcsdsTmIndex` service to calculate packet completeness.

**Note**

Index rebuilds run synchronously: this method will await the outcome.

**Parameters**

- **start** – Start time
- **stop** – Stop time

**rebuild\_histogram**(*table*: [str](#), *start*: [datetime](#) | [None](#) = [None](#), *stop*: [datetime](#) | [None](#) = [None](#))

Rebuilds the histogram for a table. This may be necessary for example after bulk loading data.

The rebuild may be constrained by using the `start` and `stop` parameters. When specified all partitions overlapping this range are reconsidered.

**Note**

Histogram rebuilds run synchronously: this method will await the outcome.

**Parameters**

- **table** – The name of the table
- **start** – Start time
- **stop** – Stop time

**rebuild\_parameter\_archive**(*start*: [datetime](#) | [None](#) = [None](#), *stop*: [datetime](#) | [None](#) = [None](#))

Rebuilds the Parameter Archive.

The rebuild may be constrained by using the `start` and `stop` parameters. These values are only hints to the Parameter Archive, which will extend the requested range based on archive segmentation.

**Note**

Rebuilds run as an asynchronous operation: this method will not await the outcome.

**Parameters**

- **start** – Start time. This argument is optional since Yamcs v5.11.4
- **stop** – Stop time. This argument is optional since Yamcs v5.11.4

`sample_parameter_values`(*parameter*: *str*, *start*: *datetime* | *None* = *None*, *stop*: *datetime* | *None* = *None*, *sample\_count*: *int* = 500, *parameter\_cache*: *str* = 'realtime', *source*: *str* = 'ParameterArchive') → *List*[*MeanSample*]

 **Warning**

Deprecated. Since yamcs-client 1.12.0 this method was renamed to `downsample_mean()`.

`stream_command_history`(*name*: *str* | *List*[*str*] | *None* = *None*, *start*: *datetime* | *None* = *None*, *stop*: *datetime* | *None* = *None*, *chunk\_size*: *int* = 32768) → *Iterable*[*CommandHistory*]

Reads command history between the specified start and stop time.

Added in version 1.9.1.

**Parameters**

- **name** – If specified, return only commands with this name.
- **start** – Minimum generation time of the returned commands (inclusive)
- **stop** – Maximum generation time of the returned commands (exclusive)

`stream_events`(*source*: *str* | *List*[*str*] | *None* = *None*, *severity*: *str* | *None* = *None*, *text\_filter*: *str* | *None* = *None*, *filter*: *str* | *None* = *None*, *start*: *datetime* | *None* = *None*, *stop*: *datetime* | *None* = *None*, *chunk\_size*: *int* = 32768) → *Iterable*[*Event*]

Reads events between the specified start and stop time.

Added in version 1.9.1.

**Parameters**

- **source** – If specified, return only events with this source.
- **severity** – The minimum severity level of the returned events. One of INFO, WATCH, WARNING, DISTRESS, CRITICAL or SEVERE.
- **text\_filter** – Filter the text message of the returned events
- **filter** – Filter query applied to returned events. Allows for both text and field search.

Added in version 1.10.1: Compatible with Yamcs v5.10.2 onwards

- **start** – Minimum generation time of the returned events (inclusive)
- **stop** – Maximum generation time of the returned events (exclusive)

`stream_packets`(*name*: *str* | *List*[*str*] | *None* = *None*, *start*: *datetime* | *None* = *None*, *stop*: *datetime* | *None* = *None*, *chunk\_size*: *int* = 32768) → *Iterable*[*Packet*]

Reads packet information between the specified start and stop time.

Added in version 1.9.1.

**Parameters**

- **name** – If specified, return only packets with this archived name.
- **start** – Minimum generation time of the returned packets (inclusive)
- **stop** – Maximum generation time of the returned packets (exclusive)

`stream_parameter_values`(*parameters*: *str* | *List*[*str*], *start*: *datetime* | *None* = *None*, *stop*: *datetime* | *None* = *None*, *tm\_links*: *str* | *List*[*str*] | *None* = *None*, *chunk\_size*: *int* = 32768) → *Iterable*[*ParameterData*]

Reads parameter values between the specified start and stop time.

Value updates are emitted for each unique generation time within the queried range. If one of the parameters does not have a value for a specific generation time, it is not included in the update.

#### Parameters

- **parameters** – Parameter(s) to be queried.
- **start** – Minimum generation time of the returned values (inclusive)
- **stop** – Maximum generation time of the returned values (exclusive)
- **tm\_links** – If set, include only values that were received through a specific link.

### 4.1.2 Model

```
class yamcs.client.ColumnData(proto)
```

Bases: `object`

**property name:** `str`

Column name.

**property value:** `Any`

Value for this column.

```
class yamcs.client.IndexGroup(proto)
```

Bases: `object`

Group of index records that represent the same type of underlying objects.

**property name:** `str`

Name associated with this group. The meaning is defined by the objects represented by this index. For example:

- In an index of events, index records are grouped by source.
- In an index of packets, index records are grouped by packet name.

**property records:** `List[IndexRecord]`

Index records within this group

```
class yamcs.client.IndexRecord(proto)
```

Bases: `object`

Represents a block of uninterrupted data (derived from the index definition for the type of underlying objects, in combination with the requested merge\_time).

**property count:** `int`

Number of underlying objects this index record represents

**property start:** `datetime`

Start time of the record

**property stop:** `datetime`

Stop time of the record

```
class yamcs.client.MeanSample(proto)
```

Bases: `object`

Provides aggregation properties over a range of a parameter's values.

Added in version 1.12.0: In earlier versions this class was called `Sample`.

**property avg:** `float` | `None`

Average (mean) value.

**property max:** `float` | `None`

Maximum value.

**property min:** `float` | `None`

Minimum value.

**property parameter\_count:** `int`

The number of parameter values this sample represents.

**property time:** `datetime`

Sample time.

**class** `yamcs.client.ParameterRange(proto)`

Bases: `object`

Indicates an interval during which a parameter's value was uninterrupted and unchanged.

**property eng\_value:** `Any` | `None`

The engineering (calibrated) value within this range.

If the request was made using `min_range` option, this will be the most-frequent value only. Retrieve the complete distribution using the `entries` attribute.

**property entries:** `List[ParameterRangeEntry]`

Value distribution within this range.

Unless the request was made using `min_range` option, there should be only one entry only.

**property parameter\_count:** `int`

The total number of parameter values within this range.

**property start:** `datetime`

Start time of this range (inclusive).

**property stop:** `datetime`

Stop time of this range (exclusive).

**class** `yamcs.client.ParameterRangeEntry(proto)`

Bases: `object`

Value holder for an engineering value and its number of appearances within a `ParameterRange`.

**property eng\_value:** `Any`

The engineering (calibrated) value.

**property parameter\_count:** `int`

The number of received parameter values during this range.

**class** `yamcs.client.ResultSet(response)`

Bases: `object`

Provides capability to consume the rows returned by a SQL query, or access related information.

**property column\_types:** `List[str]` | `None`

Column types.

**property columns:** `List[str]` | `None`

Column names. This returns `None` as long as no row has been consumed yet.

**class** `yamcs.client.Stream(proto)`

Bases: `object`

**property name:** `str`

Stream name.

`class yamcs.client.StreamData(proto)`

Bases: `object`

**property columns:** `List[ColumnData]`

Tuple columns.

**property stream:** `str`

Stream name.

`class yamcs.client.Table(proto)`

Bases: `object`

**property name:** `str`

Table name.

## 4.2 Snippets

Create an [ArchiveClient](#) for a specific instance:

```
from yamcs.client import YamcsClient

client = YamcsClient('localhost:8090')
archive = client.get_archive(instance='simulator')
```

### 4.2.1 Packet Retrieval

Print the last 10 packets:

```
for packet in islice(archive.list_packets(descending=True), 0, 10):
    print(packet)
```

Print available range of archived packets:

```
first_packet = next(iter(archive.list_packets()))
last_packet = next(iter(archive.list_packets(descending=True)))
print("First packet:", first_packet)
print("Last packet:", last_packet)

td = last_packet.generation_time - first_packet.generation_time
print("Timespan:", td)
```

Iterate a specific range of packets:

```
now = datetime.now(tz=timezone.utc)
start = now - timedelta(hours=1)

total = 0
for packet in archive.list_packets(start=start, stop=now):
    total += 1
    # print(packet)
print("Found", total, "packets in range")
```

Download raw packet binary to a file:

```
now = datetime.now(tz=timezone.utc)
start = now - timedelta(hours=1)

with open("/tmp/dump.raw", "wb") as f:
    for chunk in archive.export_packets(start=start, stop=now):
        f.write(chunk)
```

## 4.2.2 Parameter Retrieval

Retrieve the last 10 values of a parameter:

```
iterable = archive.list_parameter_values(
    "/YSS/SIMULATOR/BatteryVoltage1", descending=True
)
for pval in islice(iterable, 0, 10):
    print(pval)
```

Iterate a specific range of values:

```
now = datetime.now(tz=timezone.utc)
start = now - timedelta(hours=1)

total = 0
for pval in archive.list_parameter_values(
    "/YSS/SIMULATOR/BatteryVoltage1", start=start, stop=now
):
    total += 1
    # print(pval)
print("Found", total, "parameter values in range")
```

Iterate values of multiple parameters by unique generation time:

```
now = datetime.now(tz=timezone.utc)
start = now - timedelta(hours=1)

total = 0
for pdata in archive.stream_parameter_values(
    ["/YSS/SIMULATOR/BatteryVoltage1", "/YSS/SIMULATOR/BatteryVoltage2"],
    start=start,
    stop=now,
):
    total += 1
    # print(pdata)
print("Found", total, "updates in range")
```

## 4.2.3 Event Retrieval

Iterate a specific range of events:

```
now = datetime.now(tz=timezone.utc)
start = now - timedelta(hours=1)

total = 0
for event in archive.list_events(start=start, stop=now):
    total += 1
    # print(event)
print("Found", total, "events in range")
```

## 4.2.4 Command Retrieval

Retrieve the last 10 issued commands:

```
iterable = archive.list_command_history(descending=True)
for entry in islice(iterable, 0, 10):
    print(entry)
```

## 4.2.5 Histogram Retrieval

Print the number of packets grouped by packet name:

```
for name in archive.list_packet_names():
    packet_count = 0
    for group in archive.list_packet_histogram(name):
```

(continues on next page)

(continued from previous page)

```
for rec in group.records:
    packet_count += rec.count
print(f" {name: <40} {packet_count: >20}")
```

Print the number of events grouped by source:

```
for source in archive.list_event_sources():
    event_count = 0
    for group in archive.list_event_histogram(source):
        for rec in group.records:
            event_count += rec.count
    print(f" {source: <40} {event_count: >20}")
```

Print the number of processed parameter frames grouped by group name:

```
for group in archive.list_processed_parameter_groups():
    frame_count = 0
    for pp_group in archive.list_processed_parameter_group_histogram(group):
        for rec in pp_group.records:
            frame_count += rec.count
    print(f" {group: <40} {frame_count: >20}")
```

Print the number of commands grouped by name:

```
mdb = client.get_mdb(instance="simulator")
for command in mdb.list_commands():
    total = 0
    for group in archive.list_command_histogram(command.qualified_name):
        for rec in group.records:
            total += rec.count
    print(f" {command.qualified_name: <40} {total: >20}")
```

## 5. Link Management

The Link API provides methods that you can use to programmatically interact with a Yamcs link.

### 5.1 Reference

#### 5.1.1 Client

##### Note

LinkClient instances are usually created via `YamcsClient.get_link()`:

```
from yamcs.client import YamcsClient

client = YamcsClient('localhost:8090')
link = client.get_link(instance='simulator', link='udp-in')
# ...
```

`class yamcs.client.LinkClient(ctx: Context, instance: str, link: str)`

Client object that groups operations for a specific link.

`create_cop1_subscription(on_data: Callable[[Cop1Status], None], timeout: float = 60) → Cop1Subscription`

Create a new subscription for receiving status of the COP1 link.

This method returns a future, then returns immediately. Stop the subscription by canceling the future.

##### Parameters

- **on\_data** – Function that gets called on each `Cop1Status`.
- **timeout** – The amount of seconds to wait for the request to complete.

##### Returns

Future that can be used to manage the background websocket subscription.

`disable_cop1(bypass_all: bool = True)`

Disable COP1 for a data link.

##### Parameters

**bypass\_all** – All frames have bypass activated (i.e. they will be BD frames)

`disable_link()`

Disables this link.

`enable_link()`

Enables this link.

`get_cop1_config() → Cop1Config`

Gets the COP1 configuration for a data link.

`get_cop1_status()` → [Cop1Status](#)

Retrieve the COP1 status.

`get_info()` → [Link](#)

Get info on this link.

`initialize_cop1`(*type*: [str](#), *clcw\_wait\_timeout*: [int](#) | [None](#) = [None](#), *v\_r*: [int](#) | [None](#) = [None](#))

Initialize COP1.

#### Parameters

- **type** – One of WITH\_CLCW\_CHECK, WITHOUT\_CLCW\_CHECK, UNLOCK or SET\_VR
- **clcw\_wait\_timeout** – timeout in seconds used for the reception of CLCW. Required if type is WITH\_CLCW\_CHECK
- **v\_r** – value of v(R) if type is set to SET\_VR

`resume_cop1()`

Resume COP1.

`run_action`(*action*: [str](#), *message*: [Mapping](#)[[str](#), [Any](#)] | [None](#) = [None](#)) → [Dict](#)[[str](#), [Any](#)]

Runs the given action for this link

#### Parameters

- **action** – action identifier
- **message** – action message

#### Returns

Action result (if the action returns anything)

`sdls_get_ctr`(*spi*: [int](#)) → [int](#)

Get the sequence counter associated with a given *spi* (Security Parameter Index) on this link.

`sdls_set_ctr`(*spi*: [int](#), *new\_seq*: [int](#))

Set the sequence counter associated with a given *spi* (Security Parameter Index) on this link to *new\_seq*.

`sdls_set_key`(*spi*: [int](#), *key*: [bytes](#))

Update the *key* associated with a given *spi* (Security Parameter Index) on this link.

`sdls_set_spi`(*vc\_id*: [int](#), *spi*: [int](#))

Update the *spi* used for SDLS on the VC *vc\_id* on this link.

`sdls_set_spis`(*vc\_id*: [int](#), *spis*: [List](#)[[int](#)])

Update the *spis* used for SDLS on the VC *vc\_id* on this link. Only valid for incoming links (i.e., downlink).

`update_cop1_config`(*window\_width*: [int](#) | [None](#) = [None](#), *timeout\_type*: [str](#) | [None](#) = [None](#), *tx\_limit*: [int](#) | [None](#) = [None](#), *t1*: [float](#) | [None](#) = [None](#)) → [Cop1Config](#)

Sets the COP1 configuration for a data link.

**class** `yamcs.client.Cop1Subscription`(*manager*)

Bases: [WebSocketSubscriptionFuture](#)

Local object providing access to COP1 status updates.

Initializes the future. Should not be called by clients.

**property** `bypass_all`: [bool](#) | [None](#)

**property** `cop1_active`: [bool](#) | [None](#)

```
get_status() → Cop1Status | None
    Returns the latest known COP1 status.

property nn_r: int | None

property state: str | None

property v_s: int | None
```

### 5.1.2 Model

```
class yamcs.client.Cop1Config(proto)
    Bases: object
    COP1 configuration

    property t1: float

    property timeout_type: str

    property tx_limit: int

    property vc_id: int
        Virtual Channel ID.

    property window_width: int

class yamcs.client.Cop1Status(proto)
    Bases: object
    COP1 status

    property bypass_all: bool | None

    property cop1_active: bool

    property nn_r: int | None

    property state: str | None

    property v_s: int | None
```

## 5.2 Snippets

Create a *LinkClient* for a specific link:

```
from yamcs.client import YamcsClient

client = YamcsClient('localhost:8090')
link = client.get_link(instance='simulator', link='udp-in')
```

Enable a link:

```
link.enable_link()
```

Run a link action:

```
link.run_action(action_id, message)
```

## 6. Object Storage

The Storage API provides methods that you can use to programmatically work with Yamcs buckets and objects.

### 6.1 Reference

#### 6.1.1 Client

```
class yamcs.client.StorageClient(ctx: Context)
```

Client for working with buckets and objects managed by Yamcs.

```
create_bucket(bucket_name: str)
```

Create a new bucket.

##### Parameters

**bucket\_name** – The name of the bucket.

```
download_object(bucket_name: str, object_name: str) → bytes
```

Download an object.

##### Parameters

- **bucket\_name** – The name of the bucket.
- **object\_name** – The object to fetch.

```
get_bucket(name: str, create=False) → Bucket
```

Get a specific bucket.

##### Parameters

- **name** – The bucket name.
- **create** – If specified, create the bucket if it does not yet exist.

```
list_buckets() → Iterable[Bucket]
```

List the buckets.

```
list_objects(bucket_name: str, prefix: str | None = None, delimiter: str | None = None) → ObjectListing
```

List the objects for a bucket.

##### Parameters

- **bucket\_name** – The name of the bucket.
- **prefix** – If specified, only objects that start with this prefix are listed.
- **delimiter** – If specified, return only objects whose name do not contain the delimiter after the prefix. For the other objects, the response contains (in the prefix response parameter) the name truncated after the delimiter. Duplicates are omitted.

**remove\_bucket**(*bucket\_name*: *str*)

Remove a bucket.

**Parameters**

**bucket\_name** – The name of the bucket.

**remove\_object**(*bucket\_name*: *str*, *object\_name*: *str*)

Remove an object from a bucket.

**Parameters**

- **bucket\_name** – The name of the bucket.
- **object\_name** – The object to remove.

**upload\_object**(*bucket\_name*: *str*, *object\_name*: *str*, *file\_obj*: *str* | *IO*, *content\_type*: *str* | *None* = *None*, *metadata*: *Mapping*[*str*, *str*] | *None* = *None*)

Upload an object to a bucket.

**Parameters**

- **bucket\_name** – The name of the bucket.
- **object\_name** – The target name of the object.
- **file\_obj** – The file (or file-like object) to upload.
- **content\_type** – The content type associated to this object. This is mainly useful when accessing an object directly via a web browser. If unspecified, a content type *may* be automatically derived from the specified *file\_obj*.
- **metadata** – Optional metadata associated to this object.

## 6.1.2 Model

**class** `yamcs.client.Bucket`(*proto*, *storage\_client*: `StorageClient`)

Bases: `object`

**property created**: `datetime`

When this bucket was created.

**delete**()

Remove this bucket in its entirety.

**delete\_object**(*object\_name*: *str*)

Remove an object from this bucket.

**Parameters**

**object\_name** – The object to remove.

**property directory**: `str` | `None`

Bucket root directory. This field is only set when the bucket is mapped to the file system. Therefore it is not set for buckets that store objects in RocksDB.

**download\_object**(*object\_name*: *str*) → `bytes`

Download an object.

**Parameters**

**object\_name** – The object to fetch.

**list\_objects**(*prefix*: *str* | *None* = *None*, *delimiter*: *str* | *None* = *None*)

List the objects for this bucket.

**Parameters**

- **prefix** – If specified, only objects that start with this prefix are listed.

- **delimiter** – If specified, return only objects whose name do not contain the delimiter after the prefix. For the other objects, the response contains (in the prefix response parameter) the name truncated after the delimiter. Duplicates are omitted.

**property max\_object\_count:** `int` | `None`

Maximum allowed number of objects.

**property max\_size:** `int` | `None`

Maximum allowed total size of all objects.

**property name:** `str`

Name of this bucket.

**property object\_count:** `int`

Number of objects in this bucket.

**property size:** `int`

Total size in bytes of this bucket (excluding metadata).

**upload\_object**(*object\_name*: `str`, *file\_obj*: `str` | `IO`, *content\_type*: `str` | `None` = `None`, *metadata*: `Mapping[str, str]` | `None` = `None`)

Upload an object to this bucket.

#### Parameters

- **object\_name** – The target name of the object.
- **file\_obj** – The file (or file-like object) to upload.
- **content\_type** – The content type associated to this object. This is mainly useful when accessing an object directly via a web browser. If unspecified, a content type *may* be automatically derived from the specified `file_obj`.
- **metadata** – Optional metadata associated to this object.

**class** `yamcs.client.ObjectInfo`(*proto*, *bucket*, *storage\_client*)

Bases: `object`

**property created:** `datetime`

Return when this object was created (or re-created).

**delete**()

Remove this object.

**download**()

Download this object.

**property name:** `str`

The name of this object.

**property size:** `int`

Size in bytes of this object (excluding metadata).

**upload**(*file\_obj*: `str` | `IO`, *metadata*: `Mapping[str, str]` | `None` = `None`)

Replace the content of this object.

#### Parameters

- **file\_obj** – The file (or file-like object) to upload.
- **metadata** – Optional metadata associated to this object.

**class** `yamcs.client.ObjectListing`(*proto*, *bucket*, *storage\_client*)

Bases: `object`

property objects: `List[ObjectInfo]`

The objects in this listing.

property prefixes: `List[str]`

The prefixes in this listing.

## 6.2 Snippets

Create a `StorageClient`:

```
from yamcs.client import YamcsClient

client = YamcsClient('localhost:8090')
storage = client.get_storage_client()
```

## 7. File Transfer

The File Transfer API provides methods that you can use to programmatically work with file transfers such as CFDP.

### 7.1 Reference

#### 7.1.1 Client

`class yamcs.client.FileTransferClient(ctx: Context, instance: str)`

Client for working with file transfers (e.g. CFDP) managed by Yamcs.

`get_service(name: str) → FileTransferService`

Get a specific File Transfer service.

##### Parameters

`name` – The service name.

`list_services() → Iterable[FileTransferService]`

List the services.

`class yamcs.client.FileTransferServiceClient(ctx: Context, proto)`

`cancel_transfer(id: str) → None`

`create_filelist_subscription(on_data: Callable[[RemoteFileListing], None] | None = None, timeout: float = 60) → FileListSubscription`

`create_transfer_subscription(on_data: Callable[[Transfer], None] | None = None, timeout: float = 60) → TransferSubscription`

`download(bucket_name: str, remote_path: str, object_name: str | None, source_entity: str | None, destination_entity: str | None, options: Mapping[str, Any] | None) → Transfer`

`fetch_filelist(remote_path: str, source_entity: str | None, destination_entity: str | None, options: Mapping[str, Any] | None)`

`get_filelist(remote_path: str, source_entity: str | None, destination_entity: str | None, options: Mapping[str, Any] | None) → RemoteFileListing`

`pause_transfer(id: str) → None`

`resume_transfer(id: str) → None`

`run_file_action(file: str, action: str, message: Mapping[str, Any] | None = None) → Dict[str, Any]`

`upload(bucket_name: str, object_name: str, remote_path: str, source_entity: str | None, destination_entity: str | None, options: Mapping[str, Any] | None) → Transfer`

**class** `yamcs.client.FileListSubscription`(*manager*)

Local object providing access to filelist updates.

A subscription object stores the last filelist info for each remotepath and destination.

Initializes the future. Should not be called by clients.

**get\_filelist**(*remote\_path*: `str`, *destination*: `str`) → `RemoteFileListing` | `None`

Get the latest cached filelist for the given remote path and destination

**Parameters**

- **remote\_path** – path on the remote destination
- **destination** – remote entity name

**class** `yamcs.client.TransferSubscription`(*manager*, *service\_client*: `FileTransferServiceClient`)

Local object providing access to transfer updates.

A subscription object stores the last transfer info for each transfer.

Initializes the future. Should not be called by clients.

**get\_transfer**(*id*: `str`) → `Transfer` | `None`

Returns the latest transfer state.

**Parameters**

**id** – Transfer identifier

**list\_completed**() → `List[Transfer]`

Returns all completed transfers (successful or not).

**list\_ongoing**() → `List[Transfer]`

Returns all ongoing transfers.

**list\_transfers**() → `List[Transfer]`

Returns a snapshot of all transfer info.

## 7.1.2 Model

**class** `yamcs.client.EntityInfo`(*proto*)

Bases: `object`

**property id**: `str`

Entity ID

**property name**: `str`

Name of the entity

**class** `yamcs.client.FileTransferCapabilities`(*proto*)

Bases: `object`

**property download**: `bool`

**property filelist**: `bool`

**property has\_transfer\_type**: `bool`

**property pause\_resume**: `bool`

**property remote\_path**: `bool`

**property upload**: `bool`

```

class yamcs.client.FileTransferOption(proto)
    Bases: object
    property allow_custom_option: bool
        Whether using different values from the pre-set ones is allowed
    property associated_text: str
        Text associated with the option
    property default: Any
        Default value for the option
    property description: str
        Description for the option
    property name: str
        Name of the option
    property type: str
        Type of the option
    property values
        List of possible values for the option
class yamcs.client.RemoteFile(proto)
    Bases: object
    Represents a file on a remote entity.
    property display_name: str | None
        Optionally, a preferred displayed name of the file.
    property is_directory: bool
        Whether the file is a directory
    property modified: datetime | None
        Latest modification time of the file
    property name: str
        Identifying name of the file
    property size: int
        File size in bytes
class yamcs.client.RemoteFileListing(proto)
    Bases: object
    Represents a list of files from a remote.
    property destination: str
        Remote destination of the file list
    property files: List[RemoteFile]
        List of files
    property list_time: datetime
        Time the file list was made
    property remote_path: str
        Remote directory of the file list
class yamcs.client.FileTransferService(proto, service_client: FileTransferServiceClient)
    Bases: object

```

`cancel_transfer(id: str) → None`

Cancel a transfer

**property capabilities:** [FileTransferCapabilities](#)

Transfer capabilities

`create_filelist_subscription(on_data: Callable[[RemoteFileListing], None] | None = None, timeout: float = 60) → FileListSubscription`

Create a new filelist subscription.

#### Parameters

- **on\_data** – Function that gets called with [RemoteFileListing](#) updates.
- **timeout** – The amount of seconds to wait for the request to complete.

#### Returns

Future that can be used to manage the background websocket subscription

#### Return type

[yamcs.client.filetransfer.client.FileListSubscription](#)

`create_transfer_subscription(on_data: Callable[[Transfer], None] | None = None, timeout: float = 60) → TransferSubscription`

Create a new transfer subscription.

#### Parameters

- **on\_data** – Function that gets called with [Transfer](#) updates.
- **timeout** – The amount of seconds to wait for the request to complete.

#### Returns

Future that can be used to manage the background websocket subscription

#### Return type

[yamcs.client.filetransfer.client.TransferSubscription](#)

`download(bucket_name: str, remote_path: str, object_name: str | None = None, source_entity: str | None = None, destination_entity: str | None = None, options: Mapping[str, Any] | None = None) → Transfer`

Downloads a file from the source to a bucket.

#### Parameters

- **bucket\_name** – Name of the bucket to receive the file.
- **object\_name** – Name of the file received in the bucket.
- **remote\_path** – Name of the file to be downloaded from the source.
- **source\_entity** – Use a specific source entity. (useful in case of multiples)
- **destination\_entity** – Use a specific destination entity. (useful in case of multiples)
- **options** – File transfer options.

`fetch_filelist(remote_path: str, source_entity: str | None = None, destination_entity: str | None = None, options: Mapping[str, Any] | None = None)`

Sends a request to fetch the directory listing from the remote (destination).

#### Parameters

- **remote\_path** – path on the remote destination to get the file list
- **source\_entity** – source entity requesting the file list
- **destination\_entity** – destination entity from which the file list is needed

- **options** – option dictionary

**get\_filelist**(*remote\_path*: *str*, *source\_entity*: *str* | *None* = *None*, *destination\_entity*: *str* | *None* = *None*, *options*: *Mapping*[*str*, *Any*] | *None* = *None*) → *RemoteFileListing*

Returns the latest directory listing for the given destination.

#### Parameters

- **remote\_path** – path on the remote destination to get the file list
- **source\_entity** – source entity requesting the file list
- **destination\_entity** – destination entity from which the file list is needed
- **options** – option dictionary

**property instance**: *str*

Instance of the service

**property local\_entities**: *List*[*EntityInfo*]

List of local entities

**property name**: *str*

Name of this service.

**pause\_transfer**(*id*: *str*) → *None*

Pauses a transfer

**property remote\_entities**: *List*[*EntityInfo*]

List of remote entities

**resume\_transfer**(*id*: *str*) → *None*

Resume a transfer

**run\_file\_action**(*file*: *str*, *action*: *str*, *message*: *Mapping*[*str*, *Any*] | *None* = *None*) → *Dict*[*str*, *Any*]

Run an action on a remote file.

Available actions depend on the specific file transfer implementation that is in use.

Added in version 1.9.6.

#### Parameters

- **file** – Remote file identifier
- **action** – Action identifier
- **message** – Action message

#### Returns

Action result (if the action returns anything)

**property transfer\_options**: *List*[*FileTransferOption*]

List of possible transfer options

**upload**(*bucket\_name*: *str*, *object\_name*: *str*, *remote\_path*: *str*, *source\_entity*: *str* | *None* = *None*, *destination\_entity*: *str* | *None* = *None*, *options*: *Mapping*[*str*, *Any*] | *None* = *None*) → *Transfer*

Uploads a file located in a bucket to a remote destination path.

#### Parameters

- **bucket\_name** – Name of the bucket containing the source object.
- **object\_name** – Name of the source object.
- **remote\_path** – Remote destination.
- **source\_entity** – Use a specific source entity. (useful in case of multiples)

- **destination\_entity** – Use a specific destination entity. (useful in case of multiples)
- **options** – file transfer options

**class** `yamcs.client.Transfer(proto, service_client)`

Bases: `object`

Represents a file transfer.

**await\_complete**(*timeout: float | None = None*)

Wait for the transfer to be completed.

**Parameters**

**timeout** – The amount of seconds to wait.

**property bucket:** `str`

**cancel**()

Cancel this transfer

**property error:** `str | None`

Error message in case the transfer failed.

**property id:** `str`

Yamcs-local transfer identifier.

**is\_complete**() → `bool`

Returns whether this transfer is complete. A transfer can be completed, yet still failed.

**is\_success**() → `bool`

Returns true if this transfer was completed successfully.

**property object\_name:** `str`

**pause**()

Pause this transfer

**property reliable:** `bool`

True if this is a Class 2 CFDP transfer.

**property remote\_path:** `str`

**resume**()

Resume this transfer

**property size:** `int`

Total bytes to transfer.

**property state:** `str | None`

Current transfer state.

**property time:** `datetime | None`

Time when the transfer was started.

**property transferred\_size:** `int`

Total bytes already transferred.

## 7.2 Snippets

Create a `FileTransferClient` for a specific instance:

```

from yamcs.client import YamcsClient

client = YamcsClient('localhost:8090')
cfdp = client.get_file_transfer_client(instance='cfdp')

# Operations are grouped by service.
# Here: take the first available
service = next(cfdp.list_services())

```

Upload a file to the specified location on the remote entity:

```

# Transfer myfile from bucket to spacecraft
upload = service.upload(out_bucket.name, "myfile", "/CF:/mytarget")
upload.await_complete(timeout=10)

if not upload.is_success():
    print("Upload failure:", upload.error)
else:
    print(f"Successfully uploaded {upload.remote_path} ({upload.size} bytes)")

```

Start file download:

```

# Download todownload from the remote
download = service.download(in_bucket.name, "todownload")

```

Initiate transfer with non-default parameters:

```

# Transfer myfile, but use an alternative destination entity
upload = service.upload(
    out_bucket.name, "myfile", "/CF:/mytarget", destination_entity="target2"
)

```

Initiate transfer with extra transfer options:

```

upload = service.upload(
    out_bucket.name, "myfile", "/CF:/mytarget", options={"reliable": True}
)

```

Subscribe to file list changes:

```

subscription = service.create_filelist_subscription(on_data=filelist_callback)

```

Fetch file list from remote directory:

```

filelist_request = service.fetch_filelist("/")

```

Get the latest saved remote file list for the given directory, and display it:

```

filelist = service.get_filelist("/")

# Display file list
if filelist:
    print("File list received:")
    if not filelist.files:
        print("\tEmpty file list")
    for file in filelist.files:
        print(
            f"\t{file.name + ('/' if file.is_directory else '')}<12}\
            t{str(file.size) + ' bytes'>12}\tLast Modified: {file.modified}"
        )
    else:
        print("No filelist found")

```

## 8. Time Correlation (TCO)

The Time Correlation API provides methods that you can use to programmatically interact with a Yamcs TCO service.

### 8.1 Reference

#### 8.1.1 Client

`class` `yamcs.client.TCOClient`(*ctx*: *Context*, *instance*: *str*, *service*: *str*)

Client for interacting with a Time Correlation service managed by Yamcs.

`add_to_f_interval`(*start*: *datetime*, *stop*: *datetime*, *polynomial*: *List[float]*)

Defines a ToF interval for the ERT range [*start*, *stop*], specifying a polynomial function of the form:  $tof = a + bx + cx^2 + \dots$  where *x* is ERT minus the provided start date.

##### Parameters

- **start** – ERT start
- **stop** – ERT stop
- **polynomial** – Coefficients in the order [*a*, *b*, *c*, ...]

`add_to_f_intervals`(*intervals*: *List[ToFInterval]*)

Adds multiple ToF intervals at once.

##### Parameters

**intervals** – List of ToF intervals.

`get_status`() → *TCOStatus*

Retrieve the TCO status.

`override_coefficients`(*utc*: *datetime*, *obt*: *int*, *gradient*: *float* = 0, *offset*: *float* = 0)

Manually override the association between UTC and onboard time.

#### Note

If later on you want to revert to automatically computed coefficients, use `reset_coefficients()`.

##### Parameters

- **utc** – UTC
- **obt** – Onboard time
- **gradient** – Gradient
- **offset** – Offset

**reconfigure**(*accuracy*: *float* | *None* = *None*, *validity*: *float* | *None* = *None*, *ob\_delay*: *float* | *None* = *None*, *default\_tof*: *float* | *None* = *None*)

Updates one or more TCO options

#### Parameters

- **accuracy** – Accuracy in seconds.
- **validity** – Validity in seconds.
- **ob\_delay** – Onboard delay in seconds.
- **default\_tof** – Default ToF in seconds. This value is used if the ToF estimator does not find a matching interval.

**remove\_tof\_intervals**(*start*: *datetime*, *stop*: *datetime*)

Removes previously registered ToF intervals whose start date falls in the specified range [*start*, *stop*].

#### Parameters

- **start** – ERT start
- **stop** – ERT stop

**reset\_coefficients**()

Resets current TCO coefficients, as well as any collected samples.

## 8.1.2 Model

```
class yamcs.client.TCOCoefficients(proto)
```

Bases: `object`

TCO Coefficients

property **gradient**: `float` | `None`

property **obt**: `int` | `None`

property **offset**: `float` | `None`

property **utc**: `datetime` | `None`

```
class yamcs.client.TCOSample(proto)
```

Bases: `object`

property **obt**: `int` | `None`

property **utc**: `datetime` | `None`

```
class yamcs.client.TCOStatus(proto)
```

Bases: `object`

TCO Status

property **coefficients**: `TCOCoefficients` | `None`

Current coefficients. Or `None` if the synchronization is not yet established.

property **coefficients\_time**: `datetime` | `None`

Time when the coefficients have been computed

property **deviation**: `float` | `None`

Last computed deviation

property **samples**: `List[TCOSample]`

The last accumulated samples

```
class yamcs.client.TofInterval(start: datetime, stop: datetime, polynomial: List[float])
```

Bases: `object`

ToF interval for the ERT range [start, stop], specifying a polynomial function of the form:  $tof = a + bx + cx^2 + \dots$  where  $x$  is ERT minus the provided start date.

#### Parameters

- **start** – ERT start
- **stop** – ERT stop
- **polynomial** – Coefficients in the order [a, b, c, ...]

## 8.2 Snippets

Create a `TCOClient` for a specific instance:

```
from yamcs.client import YamcsClient

client = YamcsClient('localhost:8090')
tco = client.get_tco_client(instance='pus', service='tco0')
```

## 9. Timeline

The Timeline API provides methods that you can use to programmatically work with Yamcs bands and items.

### 9.1 Reference

#### 9.1.1 Client

`class` `yamcs.client.TimelineClient`(*ctx: Context, instance: str*)

Client for working with Yamcs timeline.

`delete_band`(*band: str*)

Delete a band.

**Parameters**

`band` – Band identifier.

`delete_item`(*item: str*)

Delete an item.

**Parameters**

`item` – Item identifier.

`delete_view`(*view: str*)

Delete a view.

**Parameters**

`view` – View identifier.

`get_band`(*id: str*) → *Band*

Fetch a band by its identifier.

**Parameters**

`id` – Band identifier

`get_item`(*id: str*) → *Item*

Fetch an item by its identifier.

**Parameters**

`id` – Item identifier

`get_view`(*id: str*) → *View*

Fetch a view by its identifier.

**Parameters**

`id` – View identifier

`list_bands`() → *Iterable[Band]*

List the bands.

`list_items`(*band*: [str](#) | [None](#) = [None](#), *start*: [datetime](#) | [None](#) = [None](#), *stop*: [datetime](#) | [None](#) = [None](#), *page\_size*: [int](#) = 500) → [Iterable](#)[[Item](#)]

List the items.

#### Parameters

- **band** – Return only items matching the specified band
- **start** – Minimum stop time of the returned items (exclusive)
- **stop** – Maximum start time of the returned items (exclusive)
- **page\_size** – Page size of underlying requests. Higher values imply less overhead, but risk hitting the maximum message size limit.

`list_views`() → [Iterable](#)[[View](#)]

List the views.

`save_band`(*band*: [Band](#))

Save or update a band.

#### Parameters

**band** – [Band](#) object

`save_item`(*item*: [Item](#))

Save or update an item.

#### Parameters

**item** – [Item](#) object

`save_view`(*view*: [View](#))

Save or update a view.

#### Parameters

**view** – [View](#) object

## 9.1.2 Model

```
class yamcs.client.Band(proto)
```

Bases: [ABC](#)

Superclass for bands. Implementations:

- [TimeRuler](#)
- [ItemBand](#)
- [ParameterPlot](#)

- [CommandBand](#)

```
property band_type: str
```

Type of band.

```
property description: str
```

Description of this band.

```
property id: str
```

Band identifier.

```
property name: str
```

Name of this band.

```

class yamcs.client.CommandBand(proto=None)
    Bases: Band
    Display issued commands.

class yamcs.client.Item(proto=None)
    Bases: object
    property activity: Activity | None
        Activity definition.
    property background_color: str | None
        CSS color string.
    property border_color: str | None
        CSS color string.
    property border_width: int | None
    property corner_radius: int | None
    property duration: timedelta
        Item duration.
    property id: str
        Item identifier.
    property item_type: str
        Type of item.
    property margin_left: int | None
    property name: str
        Name of this item.
    property start: datetime
        Item start time.
    property tags: List[str]
        Item tags. Used by bands to filter what is visible.
    property text_color: str | None
        CSS color string.
    property text_size: int | None

class yamcs.client.ItemBand(proto=None)
    Bases: Band
    Show a selection of timeline items.
    property frozen: bool
        Fix this line to the top of the view. Frozen bands are always rendered above other bands.
    property item_background_color: str
        CSS color string.
    property item_border_color: str
        CSS color string.
    property item_border_width: int
    property item_corner_radius: int

```

**property item\_height:** `int`

**property item\_margin\_left:** `int`

**property item\_text\_color:** `str`  
CSS color string.

**property item\_text\_overflow:** `str`  
One of show, clip, or hide.

**property item\_text\_size:** `int`

**property margin\_bottom:** `int`

**property margin\_top:** `int`

**property multiline:** `bool`  
Draw items on multiple lines if otherwise there would be collisions.

**property space\_between\_items:** `int`  
In case of multilining, this indicates the minimum horizontal space between items. If an item does not meet this threshold, it gets rendered on a different line.

**property space\_between\_lines:** `int`  
In case of multilining, this indicates the vertical space between lines.

**property tags:** `List[str]`  
Item tags that this band filters on.

**class** `yamcs.client.ParameterPlot(proto=None)`

Bases: `Band`

Plot the values of a numeric parameter.

Added in version 1.11.2: Compatible with Yamcs 5.11.2 onwards

**property frozen:** `bool`  
Fix this line to the top of the view. Frozen bands are always rendered above other bands.

**property height:** `int`  
Band height

**property maximum:** `float | None`  
Maximum value to show on Y-axis. Set to None for fitting actual data

**property maximum\_fraction\_digits:** `int`  
Maximum fraction digits

**property minimum:** `float | None`  
Minimum value to show on Y-axis. Set to None for fitting actual data

**property minimum\_fraction\_digits:** `int`  
Minimum fraction digits

**traces:** `List[Trace]`  
Plot lines.

**property zero\_line\_color:** `str`  
Color of the zero line

**property zero\_line\_width:** `int`  
Thickness of the zero line. 0 is invisible

```

class yamcs.client.ParameterStateBand(proto=None)
    Bases: Band
    Show state transitions of a parameter
    Added in version 1.11.2: Compatible with Yamcs 5.11.2 onwards
    property frozen: bool
        Fix this line to the top of the view. Frozen bands are always rendered above other bands.
    property height: int
        Band height
    mappings: List[ValueMapping | RangeMapping]
        Map engineering values to a label and/or color. Mappings are applied in order.
    property parameter: str
        Qualified parameter name
class yamcs.client.RangeMapping(start: float, end: float, label: str | None = None, color: str | None = None)
    Bases: object
    Maps a value to a label and/or color.
    color: str | None = None
        If specified, show states of this value (or mapped label) in this color
    end: float
        Match engineering value lesser or equal than the provided end value
    label: str | None = None
        If specified, map the provided value to this label
    start: float
        Match engineering value greater or equal than the provided start value
class yamcs.client.Spacer(proto=None)
    Bases: Band
    Insert empty vertical space.
    property height: int
        Spacer height
class yamcs.client.TimeRuler(proto=None)
    Bases: Band
    Displays absolute time, formatted in a timezone of choice.
    property timezone: str
        IANA timezone name.
        Corresponds with the third column of the following table: https://data.iana.org/time-zones/data/zone1970.tab
        In addition, the name UTC is supported.
class yamcs.client.Trace(parameter: str, line_color: str, visible: bool = True, line_width: int = 1, fill: bool = False, fill_color: str = '#ddddd', min_max: bool = False, min_max_opacity: float = 0.17)
    Bases: object
    A trace on a ParameterPlot.

```

```

fill: bool = False
fill_color: str = '#ddddd'
line_color: str
line_width: int = 1
min_max: bool = False
min_max_opacity: float = 0.17
parameter: str
visible: bool = True

```

```
class yamcs.client.ValueMapping(value: Any, label: str | None = None, color: str | None = None)
```

Bases: `object`

Maps a value to a label and/or color

```
color: str | None = None
```

If specified, show states of this value (or mapped label) in this color

```
label: str | None = None
```

If specified, map the provided value to this label

```
value: Any
```

Engineering value to match

```
class yamcs.client.View(proto=None)
```

Bases: `object`

```
property bands: List[Band]
```

Bands included in this view.

```
property description: str
```

Description of this view.

```
property id: str
```

View identifier.

```
property name: str
```

Name of this view.

## 9.2 Snippets

Create a `TimelineClient` for a specific instance:

```

from yamcs.client import YamcsClient

client = YamcsClient("localhost:8090")
timeline = client.get_timeline_client(instance="simulator")

```

Create a few `Band` objects:

```

from yamcs.client import ItemBand, TimeRuler

utc_time = TimeRuler()
utc_time.name = "UTC"
timeline.save_band(utc_time)

local_time = TimeRuler()
local_time.name = "Local"

```

(continues on next page)

(continued from previous page)

```
local_time.timezone = "Europe/Brussels"
timeline.save_band(local_time)

group_a = ItemBand()
group_a.name = "Group A"
group_a.tags = ["group-a"]
timeline.save_band(group_a)

group_b = ItemBand()
group_b.name = "Group B"
group_b.tags = ["group-b"]
group_b.item_border_color = "#ff4500"
group_b.item_background_color = "#ffa500"
timeline.save_band(group_b)
```

Create some *Item* objects. Bands of type *ItemBand* will display items with matching tags:

```
from datetime import datetime, timedelta, timezone

from yamcs.client import Item

now = datetime.now(tz=timezone.utc)

for i in range(10):
    item = Item()
    item.name = f"A {i + 1}"
    item.start = now + timedelta(seconds=i * 7200)
    item.duration = timedelta(seconds=3600)
    item.tags = ["group-a"]
    timeline.save_item(item)

    item = Item()
    item.name = f"B {i + 1}"
    item.start = now + timedelta(seconds=3600 + (i * 7200))
    item.duration = timedelta(seconds=3600)
    item.tags = ["group-b"]
    timeline.save_item(item)
```

Create a *View* showing all bands:

```
from yamcs.client import View

view = View()
view.name = "Two groups"
view.bands = [utc_time, local_time, group_a, group_b]
timeline.save_view(view)
```

To update a *Band*, *Item* or *View* use the same save methods as for inserting. When saving or fetching these objects they are assigned a server identifier that is used to detect whether further saves require an insert or update.

```
group_a.description = "A few random items"
timeline.save_band(group_a)
```

```
for item in timeline.list_items():
    item.tags.append("example")
    timeline.save_item(item)
```

Create a view with *ParameterStateBand* and *ParameterPlot* bands:

```
from yamcs.client import (
    ParameterPlot,
    ParameterStateBand,
    RangeMapping,
    Trace,
    ValueMapping,
    View,
)
```

(continues on next page)

```
states = ParameterStateBand()
states.name = "State example"
states.parameter = "/YSS/SIMULATOR/BatteryVoltage2"
states.mappings.append(RangeMapping(40, 56, label="LOW", color="#ff0000"))
states.mappings.append(ValueMapping(57, label="OK", color="#00ff00"))
states.mappings.append(RangeMapping(58, 70, label="HIGH", color="#ff0000"))
timeline.save_band(states)

plot = ParameterPlot()
plot.name = "Plot example"
plot.maximum = 65
trace = Trace(
    parameter="/YSS/SIMULATOR/BatteryVoltage2",
    line_color="#ffff00",
    fill=True,
)
plot.traces.append(trace)
timeline.save_band(plot)

view = View()
view.name = "Parameter examples"
view.bands = [states, plot]
timeline.save_view(view)
```

## 10. Examples

All of these examples run against a simulation that is used to develop and demo Yamcs. This setup is linked to a simple simulator which emits TM in the form of CCSDS packets and accepts a few telecommands as well.

Most of the telemetered parameters are in a space system called /YSS/SIMULATOR.

### 10.1 alarms.py

```
from time import sleep

from yamcs.client import YamcsClient

def receive_callbacks():
    """Registers an alarm callback."""

    def callback(alarm_update):
        print("Alarm Update:", alarm_update)

    processor.create_alarm_subscription(callback)

def acknowledge_all():
    """Acknowledges all active alarms."""
    for alarm in processor.list_alarms():
        if not alarm.is_acknowledged:
            processor.acknowledge_alarm(
                alarm.name,
                alarm.sequence_number,
                comment="false alarm",
            )

if __name__ == "__main__":
    client = YamcsClient("localhost:8090")
    processor = client.get_processor(instance="simulator", processor="realtime")
    receive_callbacks()
    sleep(10)

    print("Acknowledging all...")
    acknowledge_all()

    # If a parameter remains out of limits, a new alarm instance is created
    # on the next value update. So you would keep receiving callbacks on
    # the subscription.

    # The subscription is non-blocking. Prevent the main
    # thread from exiting
    while True:
        sleep(10)
```

## 10.2 archive\_breakdown.py

```
from yamcs.client import YamcsClient

def print_packet_count():
    """Print the number of packets grouped by packet name."""
    for name in archive.list_packet_names():

```

## 10.5 ccsds\_completeness.py

### Note

CCSDS Completeness is a concept specific to CCSDS-style packets. If you store a different type of packet in Yamcs, then this code example is not applicable.

```

from datetime import datetime, timedelta, timezone

from yamcs.client import YamcsClient

def print_latest():
    """
    Prints completeness records for the last two days
    """
    now = datetime.now(tz=timezone.utc)
    start = now - timedelta(days=2)

```

```

# Results are returned in records per 'group'.
# A completeness group matches with a CCSDS APID.

# We may receive multiple groups with the same APID
# depending on how much data there is for the selected
# range.

# Combine all returned pages by APID
records_by_apid = {}
for group in archive.list_completeness_index(start=start, stop=now):
    if group.name not in records_by_apid:
        records_by_apid[group.name] = []
    records_by_apid[group.name].extend(group.records)

for apid, records in records_by_apid.items():
    print("APID:", apid)

    total = 0
    for rec in records:
        print("  ", rec)
        total += rec.count
    print(f" --> Total packets for {apid}: {total}")

if __name__ == "__main__":
    client = YamcsClient("localhost:8090")
    archive = client.get_archive(instance="simulator")
    print_latest()

```

## 10.6 commanding.py

```

from time import sleep

from yamcs.client import VerificationConfig, YamcsClient

def issue_command():
    """Issue a command to turn battery 1 off."""
    command = processor.issue_command(
        "/YSS/SIMULATOR/SWITCH_VOLTAGE_OFF", args={"voltage_num": 1}

## 10.19 write\_mdb.py

If a system is marked as *writable* in the loader tree, Yamcs becomes responsible for updating the file, and the HTTP API can then be used to update it. This capability exists only for XTCE files.

Note that this functionality is experimental, and does not offer the same degree of customizations as when loading the MDB from a predefined XTCE file.

To demonstrate this capability, add a writable subsystem test to the [Yamcs Quickstart](#) example:

#### mdb/yamcs.myproject.yaml

```
mdb:
- type: xtce
  args:
    file: mdb/xtce.xml
  subLoaders:
    - type: xtce
      writable: true
      args:
        file: /path/to/test.xml
```

Because the quickstart example works on a copy of the files (in target/yamcs/), we specify test.xml as an absolute rather than relative reference.

The initial content can just be an empty XTCE SpaceSystem, specifying its name:

#### mdb/test.xml

```
<?xml version="1.0" encoding="UTF-8"?>
<SpaceSystem xmlns="http://www.omg.org/spec/XTCE/20180204" name="test">
</SpaceSystem>
```

Then you can add parameter types and values like this:

```
from yamcs.client import NotFound, YamcsClient

"""
The following example requires a _writable_ system.

In this example the system ``/myproject/test`` is writable, whereas
the top-level system ``/myproject`` is populated based on a predefined
XTCE file (not managed by Yamcs itself).
"""

if __name__ == "__main__":
    client = YamcsClient("localhost:8090")
    mdb = client.get_mdb(instance="myproject")

    system = "/myproject/test"
    try:
        mdb.get_parameter_type(f"{system}/float_t")
    except NotFound:
        mdb.create_parameter_type(f"{system}/float_t", eng_type="float")

    try:
        mdb.get_parameter(f"{system}/testparam")
    except NotFound:
        mdb.create_parameter(
            f"{system}/testparam",
            data_source="LOCAL",
            parameter_type=f"{system}/float_t",
        )

    # MDB is present, now publish a parameter value
    processor = client.get_processor("myproject", "realtime")
    processor.set_parameter_value(f"{system}/testparam", 123.4)
```

Afterwards you should see that test.xml has been updated automatically:

#### mdb/test.xml

```
<?xml version="1.0" encoding="UTF-8"?>
<SpaceSystem xmlns="http://www.omg.org/spec/XTCE/20180204" name="test">
  <TelemetryMetaData>
    <ParameterTypeSet>
      <FloatParameterType sizeInBits="32" name="float_t">
        <UnitSet/>
      </FloatParameterType>
```

(continues on next page)

(continued from previous page)

```
</ParameterTypeSet>
